The Health Physics groups at Los Alamos determined that the 15 yr-old alpha CAM instrumentation in use at the Laboratory would soon have to be replaced and upgraded. A program was initiated to prepare detailed performance specifications, evaluate new CAM instrumentation being offered, and if necessary, to develop advanced technologies which would enable the Laboratory to meet or exceed all of the requirements of the new DOE Order 5480.11. "Radiation Protection for Occupational Workers" (DOE, 1988), and other related Orders and standards. After careful evaluation of available alpha CAMs and consideration of the many factors affecting CAM performance, a project for the design, and development of advance CAM technology was initiated. This project culminated in the completion of a new alpha CAM concept featuring advances in the design of the CAM inlet enabling discrimination against radon daughters, in the multi-channel analyzer electronics, in the data processing and communication electronics, and in background compensation algorithm. The objective in the following discussion is examine the DOE Order 5480.11 requirements in some detail. While the new CAM sensitivity requirement is of critical importance, this is only one of many requirements of the Order with implications for CAM design, placement and operation. It is essential to orient our thinking about CAMs to the primary objectives of the Order with air monitoring implications. This paper discusses air monitoring issues in the Order. 7 refs.

**35014** (LBL–27170-1991) **Annual site environmental report of the Lawrence Berkeley Laboratory: Data for calendar year 1990.** Schleimer, G.E.; Pauer, R.O. (eds.). Lawrence Berkeley Lab., CA (United States). May 1991. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000646. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Monitoring Program of the Lawrence Berkeley Laboratory is described. Data for 1990 are presented, and general trends are discussed. The report is organized under the following topics: Environmental Program Overview; Environmental

Permits; Environmental Assessments; Environmental Activities; Penetrating Radiation; Airborne Radionuclides; Waterborne Radionuclides; Public Doses Resulting from LBL Operations; Trends – LBL Environmental Impact; Waterborne Pollutants; Airborne Pollutants; Groundwater Protection; and Quality Assurance. 20 refs., 26 figs., 23 tabs.

**35015** (LBL–31118) **Soot in the stratosphere: The impact of current and HSCT aircraft emissions.** Hansen, A.D.A. (Lawrence Berkeley Lab., CA (United States)); Pueschel, R.F.; Snetsinger, K.G. Lawrence Berkeley Lab., CA (United States). Aug 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Contract A97524C. (CONF-9109290–1: Aircraft design meeting, Baltimore, MD (United States), 23-25 Sep 1991). Order Number DE92000686. Source: OSTI; NTIS; GPO Dep.

One of the trace components of emissions from aircraft engines and other combustion sources are soot particles. These particles are strongly absorbing in the visible and IR spectra, may act as condensation nuclei, and may provide a large surface area for the catalytic promotion of gas-phase chemical reactions. Soot if found throughout the troposphere, even at remote locations, and also in the stratosphere. Present techniques do not allow an unambiguous identification of the sources. This paper discusses the emission of soot from existing and proposed aircraft and the contribution of this soot to concentrations observed in the troposphere and stratosphere. We consider the implications of these emissions for issues in stratospheric physics and chemistry. 11 refs.

**35016** (NEI-DK–638) **Formation of hygrogen chloride during waste incineration.** Dalager, S.; Hansen, L. DK-Teknik, Soeborg (Denmark). Oct 1990 90p. (In Danish). Order Number DE92703888. Source: OSTI; NTIS (US Sales Only).

1.75 million tons of mainly municipal, but also industrial, wastes are incinerated in Denmark each year. Danish authorities are concerned about the emission of hydrogen chlorides caused by the combustion of PVC. A description of the character of the flue gas, fly ash and slag produced by waste incineration is given in addition to a brief explanation of various methods used for flue gas cleaning. The kinetics of PVC combustion are also presented. (AB) 10 refs.

**35017** (ORNL/TM–11895) **A standard test set for numerical approximations to the shallow water equations in spherical geometry.** Williamson, D.L. (National Center for Atmospheric Research, Boulder, CO (United States)); Hack, J.J.; Jakob, R.; Swarztrauber, P.N.; Drake, J.B. Oak Ridge National Lab., TN (United States). Aug 1991. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000385. Source: OSTI; NTIS; GPO Dep.

A suite of seven test cases is proposed for the evaluation of numerical methods intended for the solution of the shallow water equations in spherical geometry. The shallow water equations exhibit the major difficulties associated with the horizontal dynamical aspects of atmospheric modeling on the spherical earth. These cases are designed for use in the evaluation of numerical methods proposed for climate modeling and to identify the potential tradeoffs which must always be made in numerical modeling. Before a proposed scheme is applied to a full baroclinic atmospheric model it must perform well on these problems in comparison with other currently accepted numerical methods. The cases are presented in order of complexity. They consist of advection across the poles, steady state geostrophically balanced flow of both global and local scales, forced nonlinear advection of an isolated low, zonal flow impinging on an isolated mountain, Rossby-Haurwitz waves and observed atmospheric states. One of the cases is also identified as a computer performance/algorithm efficiency benchmark for assessing the performance of algorithms adapted to massively parallel computers. 31 refs.

**35018** (RFP–4451) **Development of a non-radiological air emissions inventory for a nuclear industrial facility.** Patnoe, C.A.; Porter, G.V.; Almquist, R.S. EG and G Rocky Flats, Inc., Golden, CO (United States). [1991]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9109253–1: Joint EPA and Air and Waste Management Association (AWMA), air inventory issues of the 1990's, Durham, NC (United States), 11 Sep 1991). Order Number DE91018395. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the major issues that impacted the organization and structure of a project for developing a comprehensive non- radiological air emissions inventory for a nuclear weapons facility. The major issues addressed paralleled the development of the inventory project and fall into the following categories: (1) defining the scope of work, (2) developing and managing the air emission inventory project, and (3) field investigations and evaluating operations for air emissions. This paper also describes the lines of communication that were established with state regulators to resolve problems and develop a successful working relationship. This paper illustrates a means to complete a complex air emission inventory with proper organization and cooperation with regulatory agencies. Further, it indicates the need of critical evaluation of project tasks to evaluate their impact on project schedule; it provides a method for implementing a quality assurance program that audits all phases of the emission survey; and it demonstrates a way of effectively managing outside contractors to meet schedule requirements and assure a high quality product. This paper is of value to those undertaking a similar complex air emission survey. 2 refs.

**35019** (UCRL-ID–108377) **A condensed global photochemical mechanism for two-dimensional atmospheric models.** Tamaresis, J.; Kinnison, D.E.; Wuebbles, D.J. Lawrence Livermore National Lab., CA (United States). [1991]. 24p. Sponsored by Environmental Protection Agency, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000101. Source: OSTI; NTIS; GPO Dep.

A condensed chemical mechanism that represents the reactions of organic compounds in the atmosphere is developed and tested using a one-dimensional model. Due to the differences between the full and condensed mechanisms, the reduced version cannot be considered an accurate predictor of globally important trace species concentrations. The condensed mechanism must be improved before it can be used with confidence in two-dimensional models. Appendix contains both full and reduced mechanisms of photolysis and thermal reactions as well as species profile comparisons. 3 refs., 8 figs.

**35020** (UCRL-JC–106334) **Statistical character of toxic metal concentrations in soil samples contaminated by atmospheric deposition: Implications for compliance.** Shinn, J.H.; Gouveia, F.J. Lawrence Livermore National Lab., CA (United States). May 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910659–33: 84. annual meeting and exhibition of the Air and Waste Management Association (AWMA), Vancouver (Canada), 16-21 Jun 1991). Order Number DE91018467. Source: OSTI; NTIS; GPO Dep.

The requirements of recent regulations for airborne toxic substances are sometimes interpreted to mean an assessment of the fate and environmental effects of metal particles deposited on the landscape by atmospheric processes. This paper examines the problems of sampling soil for deposited metals. The statistical character of contaminants in soil is not well understood by the administrators of environmental compliance, nor by persons responsible for soil sampling. Fortunately, there have been sufficient studies of metal concentrations in soil contaminated by atmospheric deposition that some generalizations can be drawn. Here we show some practical results that will aid in answering many questions about soil sampling such as: How many samples are required to estimate the central tendency (mean or median)? How large should an analyzed aliquot be to assure reproducible results? How many samples in a population will be out of compliance when the mean or median is well within compliance? When remedial action is taken, how clean is clean? 6 refs., 2 figs.

**35021** (VTT-TIED–1199) **$SO_2$ and $NO_x$ emission scenarios and the costs of reduction measures in Finland.** Taehtinen, M. (Valtion Teknillinen Tutkimuskeskus, Otaniemi (Finland). Ydinvoimatekniikan Lab.). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Jan 1991. 55p. (In Finnish). Order Number DE92704005. Source: OSTI; NTIS (US Sales Only).

Sulphur emissions are calculated on the basis of fuel consumption, sulphur content of fuels, assumptions on the development of production in process industry. Emission reduction measures are taken into account. In calculation of $NO_x$ emissions prognosis of car fleet and traffic performance are also needed. Sulphur emissions have been calculated for two main control strategies: reduction measures mandated by the Finnish government, and strict reduction measures to test the effect of best available emission abatement measures. Nitrogen oxides emissions are calculated with emission reduction measures proposed by the Nitrogen Oxides Commission. Potential of energy conservation and use of nature gas is considered and control costs caused by different strategies are estimated. The emission restrictions confirmed by the state will decrease the sulphur dioxid emissions to a level of 200000 tons per year. Estimated control costs are in the year 2000 about 700 million FIM (per year). If energy is used in a more effective war use of natural gas is increased and the reduction measures are stricter, it is possible to reach a yearly sulphur dioxide emission level of 100000 tons after the year 2000. Estimated control costs for stricter reduction measures are about 1000 million FIM per year. Reduction of nitrogen oxides emissions is more difficult and more expensive than reduction of sulphur emissions. Catalytic converters in passenger cars will stop the growth of the total $NO_x$ emissions in Finland. To decrease the total $NO_x$ emission restrictions are also needed for energy production and industrial plants as well as for other car types.

35022 (WHC-EP–0145-3) **Westinghouse Hanford Company Environmental surveillance annual report–200/600 Areas: Calendar year 1990.** Schmidt, J.W.; Huckfeldt, C.R.; Johnson, A.R.; McKinney, S.M. Westinghouse Hanford Co., Richland, WA (United States). Jun 1991. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE91018137. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the results of near-field environmental surveillance in 1990 of the Operations Area of the Hanford Site, in south central Washington State, as performed by Westinghouse Hanford Company. These activities are conducted in the 200 and 600 Areas to assess and control the impacts of operations on the workers and the local environment. Surveillance activities include sampling and analyses of ambient air, surface water, groundwater, sediments, soil, and biota. Also, external radiation measurements and radiological surveys are taken of waste disposal sites, radiological control areas, and roads. 16 refs., 3 figs., 1 tab.

35023 (ANL/CP–72961) **Effect of radon dose on cleanup criteria and using RESRAD for chemical risk assessment.** Yu, C. (Argonne National Lab., IL (United States)); Cheng, J.-J.; Wallo, A. III. Argonne National Lab., IL (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-910931–20: Environmental remediation '91 conference, Pasco, WA (United States), 8-11 Sep 1991). Order Number DE92000356. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy has used RESRAD, a pathway analysis program developed at Argonne National Laboratory, in conjunction with the as low as reasonably achievable (ALARA) principle to develop site-specific residual radioactive material guidelines (cleanup criteria) for many sites. This study examines the effects of the radon pathway, recently added to the RESRAD program, on the calculation of uranium, radium, and thorium cleanup criteria. The results show that the derived uranium guidelines will not be affected by the radon ingrowth considerations. The effect of radon on radium and thorium generic guidelines is more significant, but the model does indicate that at the generic soil limits used for radium and thorium the indoor radon decay product concentrations would be below the 0.02 working level standard. This study also examines the feasibility of applying RESRAD to chemical risk assessment. The results show that RESRAD can perform risk assessment of toxic chemicals after simple modifications. Expansion of the RESRAD database to include chemical compounds will increase its capability to handle chemical risk assessments. 11 refs., 3 tabs.

35024 (ANL/CP–73676) **Geophysical identification of leachate levels and refuse characterization in a landfill at Argonne National Laboratory, Illinois.** Carpenter, P.J. (Northern Illinois Univ., De Kalb, IL (United States). Dept. of Geology); Xi, Y.; El-Hussain, I.W.; Moos, L. Argonne National Lab., IL (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9109134–1: 34. annual meeting of the Association of Engineering Geologists: environmental and geotechnical challenges for the decade, Chicago, IL (United States), 30 Sep - 4 oct 1991). Order Number DE92000264. Source: OSTI; NTIS; GPO Dep.

Magnetic and electrical geophysical techniques were used to survey the 800 Area landfill at Argonne National Laboratory as part of an environmental site assessment. This landfill was opened in 1966 and has accepted non-radioactive laboratory, office, food service and construction wastes. Magnetic profiles and electrical resistivity surveys using Wenner, Schlumberger and dipole-dipole arrays were made primarily over the northern portion of the landfill and long its margins. Mounding of leachate to within 5 ft. (1.5 m) of the surface was identified within the north-central and northeastern portions of the landfill using resistivity soundings and dipole-dipole surveys. Soundings also suggest refuse thickness varies from 10–30 ft (3–10 m) south to north across the landfill. Both dipole-dipole and magnetic profiles have identified conductive and insulating objects in the refuse. Areas of low resistivity flanking the northeastern and eastern margins of the landfill may represent migration of leachate to the north and east. High resistivity layers detected beneath the landfill suggest little or no downward percolation of mineralized leachate. Such high resistivity layers, however, may indicate the presence of sand and gravel layers/lenses embedded in the drift which are potential contaminant pathways. The geophysical results are presently being used in optimum placement of monitoring wells, soil gas probes and future remediation planning. 5 refs., 6 figs.

35025 (CONF-9108159–1) **Radon transport and entry in hilly karst terrains.** Gammage, R.B.; Dudney, C.S.; Wilson, D.L. Oak Ridge National Lab., TN (United States). Aug 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Department of Energy-Office of Health and Environmental Research (DOE-OHER) radon contractors' meeting; Albuquerque, NM (United States); 23-25 Aug 1991. Order Number DE91018938. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of copies of the view graphs used for the talk "Radon Transport and Entry in Hilly Karst Terrains," presented at the DOE-OHER Radon Contractors' Meeting held in Albuquerque in August, 1991. The report describes how aerostatic effects can alter indoor radon concentrations, using houses in Oak Ridge and Huntsville as examples. Due to differing terrain topologies, houses in Huntsville have peak radon concentrations in the summer, roughly twice as high as winter values; Oak Ridge houses have peak radon concentrations in the winter, up to 50 times higher than summer values. A critical parameter for subsurface aerostatic transport of radon is the temperature differential between outside air and air in the underground solution cavities. The transport mechanism identified here should operate in other hilly region with karst or fractured/porous bedrock; some of the 100,000 "hottest" houses in the US are in karst regions. 3 figs., 1 tab. (MHB)

35026 (CONF-910920–2) **Seasonal trends in environmental tritium concentrations in a small forest adjacent to a radioactive waste storage area.** Amano, Hikaru (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)); Garten, C.T. Jr. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. topical meeting on tritium technology in fission, fusion, and isotopic applications; Albuquerque, NM (United States); 30 Sep - 4 oct 1991. Order Number DE91018937. Source: OSTI; NTIS; GPO Dep.

Tritium (HTO) concentrations were studied for an entire year in a floodplain forest adjacent to a low-level radioactive solid waste storage area (SWSA No. 5) at Oak Ridge National Laboratory (ORNL) near Oak Ridge, Tennessee, USA. Tritium in soil was the principal source of HTO to the deciduous forest. Evaporation from the surface soil along with transpiration from trees leaves both contributed to HTO in the forest atmosphere. During the growing season, transpiration was the principal contributor of HTO to the forest atmosphere, while during the dormant season, the main source of atmospheric HTO was evaporation from the surface soil. Seasonal changes and the characteristics of vegetation will influence the relative importance of evaporation and transpiration as sources of atmospheric HTO near the ground in temperate deciduous forests. 8 refs., 9 figs.

**35027** (CONF-9109234–6) **Patterns of sediment accumulation in Watts Bar Reservoir based on $^{137}$Cesium.** Brandt, C.C.; Rose, K.A.; Cook, R.B.; Dearstone, K.C.; Brenkert, A.L.; Olsen, C.R. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. Tennessee water resources symposium; Knoxville, TN (United States); 24-26 Sep 1991. Order Number DE92000067. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has recently undertaken an environmental restoration program designed to achieve remediation of hazardous materials released from the Oak Ridge Reservation (ORR). The distribution of $^{137}$Cs was investigated in sediments from Watts Barr Reservoir and the Clinch River as a possible marker for other contaminants released from the ORR. We have performed additional analyses on the data gathered for this study to investigate possible relationships between $^{137}$Cs accumulation and reservoir characteristics. We found that $^{137}$Cs deposition correlates with sedimentation rate, and soft mud layers of cores have higher $^{137}$Cs levels than sandy mud or eroded soils. No correlation was found with water depth, distance from shore or distance from release source, but it is important to note the data were not collected to test for these effects. We estimate Watts Barr Reservoir contains 267 Ci of $^{137}$Cs, with 7% of this total in the top 16 cm of sediment, and potentially available for biological accumulation. 2 refs. (MHB)

**35028** (CONF-911254–2) **Humic substance formation during wastewater infiltration.** Siegrist, R.L. (Oak Ridge National Lab., TN (United States)); Hildmann-Smed, R.; Filip, Z.K.; Jenssen, P.D. Oak Ridge National Lab., TN (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. national symposium on onsite waste-water treatment; St. Joseph, MI (United States); 16-17 Dec 1991. Order Number DE92000045. Source: OSTI; NTIS; GPO Dep.

Soil infiltration of wastewater effluents is a widely practiced method of treatment and disposal/reuse throughout the world. Renovation of the wastewater results from a wide variety of complex physicochemical and biological processes. One set of processes is speculated to involve the accumulation of organic matter by filtration and sorption followed by formation of humic substances. This humic substance formation can effect the performance of soil treatment systems by contributing to soil pore clogging and reduction in hydraulic capacity, and by yielding reactive substances and an enhancement of purification processes. While there has been a wealth of research into the nature and genesis of humic substances in terrestrial environments, there has been limited research of humic substance formation during soil infiltration of wastewater. The purpose of the research reported herein was to determine if humic substances can form under conditions typical of those present during wastewater infiltration into natural soil systems. This work was conducted during 1989 to 1990 as a collaborative effort between the Centre for Soil and Environmental Research, located in Aas, Norway and the Institute for Water, Soil and Air Hygiene located in Langen, West Germany. 11 refs., 3 figs., 6 tabs.

**35029** (DOE/EA–0467) **Environmental Assessment for the Sacramento Area Office, Western Area Power Administration: Proposed 1994 Power Marketing Plan.** USDOE Western Area Power Administration, Washington, DC (United States). Jun 1991. 99p. Sponsored by USDOE, Washington, DC (United States). Order Number DE91018451. Source: OSTI; NTIS; GPO Dep.

The Western Area Power Administration (Western) a Federal Power Marketing Administration within the US Department of Energy, is developing a power marketing plan for Central Valley Project (CVP) power resources that are marketed by Western's Sacramento Area Office (SAO). The plan will govern the sale of power currently sold under electric service contracts which will expire on June 30, 1994. Contracts with other customers, which expire in 2004, will not be covered by the 1994 Power Marketing Plan. As a public agency marketing public power, Western conducts a public process for determining the classes of service it markets and the recipient of the power. Proposals are made and discussed with customers, potential customers, and interested parties, in public information forums, and formal comments are made by the public on the draft plan in a public comment forum. Based on Western's analysis and comments received from interested parties during the scoping process held pursuant to the National Environmental Policy Act (NEPA), four alternative marketing plans have been developed, two of which contain several options. There are three different categories of actions which could be affected by the Proposed Marketing Plan. These are: hydrosystem operations, thermal system operations, and conservation and renewable resources. Changes in these actions could cause environmental impacts. In addition, the chosen Marketing Plan will have some socioeconomic impacts. This Environmental Assessment (EA) addresses the potential environmental impacts of Western's Marketing Plan alternatives. It also includes a discussion of the need for the Marketing Plan and of the public involvement and consultation activities related to the Marketing Plan and the environmental process. Background information on SAO's marketing program is included along with a discussion of the assumptions and methodology and a glossary of power marketing terms and abbreviations used. 5 figs., 37 tabs.

**35030** (DOE/NV/10845–2) **Radionuclides in surface soil at the Nevada Test Site.** McArthur, R.D. Nevada Univ., Las Vegas, NV (United States). Water Resources Center. Aug 1991. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE91018825. Source: OSTI; NTIS; INIS; GPO Dep.

In 1981, the US Department of Energy began the Radionuclide Inventory and Distribution Program, an attempt to assess the amount and distribution of radioactivity in surface soil at the Nevada Test Site (NTS). Over the next several years, researchers used a combination of aerial radiological surveys, soil sampling, and in situ measurements to study the regions of the NTS where soil radioactivity was above background levels. These regions included the ground zeros of above-ground nuclear tests, underground tests that vented, and some safety shots, as well as the sites of nuclear rocket experiments. The results of the program were published in a series of five reports between 1983 and 1989. In this report, those results have been combined to provide an integrated picture of the current levels of soil radioactivity on the NTS. The estimated inventories of the nine most important manmade radionuclides have been reviewed (and in some cases recalculated), decay-corrected to January 1, 1990, and tabulated. New distribution maps have been prepared that show isopleths of decay-corrected radionuclide concentrations over the entire NTS. Two additional maps show the measurement locations where the gamma exposure rate exceeds 100 $\mu$R/hr and where the $^{239,240}$Pu concentration exceeds 500 pCi/g. 21 refs., 12 figs., 6 tabs.

**35031** (DOE/NV/10845–67) **Archaeological studies at Drill Hole U20az Pahute Mesa, Nye county, Nevada.** Simmons, A.H.; Hemphill, M.L.; Henton, G.H.; Lockett, C.L.; Nials, F.L.; Pippin, L.C.; Walsh, L. Nevada Univ., Reno, NV (United States). Desert Research Inst. Jul 1991. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-85NV10384 ;AC08-90NV10845. Order Number DE92000109. Source: OSTI; NTIS; GPO Dep.

During the summer of 1987, the Quaternary Sciences Center (formerly Social Science Center) of the Desert Research Institute (DRI), University of Nevada System, conducted data recovery investigations at five archaeological sites located near Drill Hole U20az on the Nevada Test Site in southern Nevada. These sites were among 12 recorded earlier during an archaeological survey of

the drill hole conducted as part of the environmental compliance activities of the Department of Energy (DOE). The five sites discussed in this report were considered eligible for the National Register of Historic Places and were in danger of being adversely impacted by construction activities or by effects of the proposed underground nuclear test. Avoidance of these sites was not a feasible alternative; thus DRI undertook a data recovery program to mitigate expected adverse impacts. DRI's research plan included controlled surface collections and excavation of the five sites in question, and had the concurrence of the Nevada Division of Historic Preservation and Archaeology and the Advisory Council of Historic Preservation. Of the five sites investigated, the largest and most complex, 26Ny5207, consists of at least three discrete artifact concentrations. Sites 26Ny5211 and 26Ny5215, both yielded considerable assemblages. Site 26Ny5206 is very small and probably is linked to 26Ny5207. Site 26Ny5205 contained a limited artifact assemblage. All of the sites were open-air occurrences, and, with one exception contained no or limited subsurface cultural deposits. Only two radiocarbon dates were obtained, both from 26Ny5207 and both relatively recent. While the investigations reported in the volume mitigate most of the adverse impacts from DOE activities at Drill Hole U20az, significant archaeological sites may still exist in the general vicinity. Should the DOE conduct further activities in the region, additional cultural resource investigations may be required. 132 refs., 71 figs., 44 tabs.

**35032** (DOE/OR–968) **Environmental Restoration and Waste Management Site-Specific Plan for the Oak Ridge Reservation: FY1992.** Department of Energy, Oak Ridge, TN (United States). Oak Ridge Operations Office; Science Applications International Corp., Oak Ridge, TN (United States). Sep 1991. 216p. Sponsored by USDOE, Washington, DC (United States). (ES/ER–20). Order Number DE92000028. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy (DOE) is committed to achieving and maintaining environmental regulatory compliance at its waste sites and facilities, while responding to public concerns and emphasizing waste minimization. DOE publishes the Environmental Restoration and Waste Management Five-Year Plan (FYP) annually to document its progress towards these goals. The purpose of this Site-Specific Plan (SSP) is to describe the activities, planned and completed. undertaken to implement these FYP goals at the DOE Field Office-Oak Ridge (DOE/OR) installations and programs; specifically, for the Oak Ridge Reservation (ORR), Oak Ridge Associated Universities (ORAU), and Hazardous Waste Remedial Action Program (HAZWRAP). Activities described in this SSP address hazardous, radioactive, mixed, and sanitary wastes, along with treatment, storage, and disposal of current production waste and legacy waste from past operation. The SSP is presented in sections emphasizing Corrective Activities (A), Environmental Restoration (ER), Waste Management (WM), Technology Development (TD), and Transportation; and includes descriptions of activities, resources, and milestones by installation or program. 87 tabs.

**35033** (EGG–1183-1412) **ARMS (Aerial Radiological Measuring Surveys): Humboldt Bay environmental radiation survey, October–November 1967.** Hand, J.E.; Weissman, V.F. EG and G, Inc., Las Vegas, NV (United States). 13 Nov 1968. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018218. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring Surveys (ARMS), operated by EG&G, Inc., Las Vegas, Nevada, for the US Atomic Energy Commission, performed a radiation survey of the Humboldt Bay, California, area between September 28 and October 16, 1967. The survey was made for the Civil Effects Test Operations (CETO) of the Division of Biology and Medicine as part of a continuing nationwide ARMS program started in 1948. One map summarizes the aerial survey activities that have been completed to November, 1967. Other surveys maps and data are included in the survey report. The shoreline of Humboldt Bay, California, is the site of an operational power reactor operated by the Pacific Gas and Electric Company. The reactor is a boiling-water type operating at a normal power level of 52 Megawatts (electrical) which generates continuous gaseous radioactivity waste which is emitted from the exhaust stack. The results of the present survey show that the emitted nuclides are primarily the fission-generated noble gases. Dispersion of these wastes is by atmospheric diffusion over the surrounding countryside, by rainout and similar methods of natural atmospheric scrubbing, and by radioactive decay processes. 9 refs., 16 figs., 5 tabs.

**35034** (EGG–1183-1466) **Aerial Radiological Measuring Surveys (ARMS): Dresden, September 1968.** Anderson, C.N.; Weissman, V.F. EG and G, Inc., Las Vegas, NV (United States). 1 Feb 1970. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018216. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring Surveys (ARMS) system , operated for the US Atomic Energy Commission, was used to perform aerial surveys of several operational and non-operational reactor sites during the summer months of 1968. The data collected on this survey provides a catalog file of characteristics of the procedure nuclear installation. The Dresden reactor site is located in northeast Illinois, approximately 10 miles east of the community of Morris. Currently operating at the site is Dresden 1, a boiling water reactor with a capacity of 200 MW(e), owned and operated by the Commonwealth Edison Company. In addition, construction has begun at the same site for Dresden 2 and 3, each to have an 800 MW(e) capability. Information included consists of (1) aerial photographs of the installation, (2) aerial radiation survey data consisting of exposure rates normalized to 3 feet above the ground plus gamma ray spectral charts, (3) effluent characterization for operational sites – intensity rates and isotope constituents, and (4) pertinent descriptive information of the installation. The data included and discussed in this report is considered to be the catalog file for the Dresden reactor site. The ARMS equipment and procedures employed to conduct this survey and evaluate the results are described in EG&G technical report 2 83–1457. 13 figs., 4 tabs.

**35035** (EGG–1183-1525) **Aerial Radiological Measuring Surveys (ARMS): Big Rock Point, August 1968.** Sevart, M.D. EG and G, Inc., Las Vegas, NV (United States). 13 Aug 1971. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018214. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS), operated for the US Atomic Energy Commission, was used to perform aerial surveys of several operational and non-operations reactor sites during the summer months of 1968. The data collected on the these surveys included aerial photographs of the installations, aerial radiation survey data consisting of exposure rates normalized to 3 feet above the ground plus gamma-ray spectral charts, effluent characterization for operational sites (intensity rates and isotope constituents), and pertinent descriptive information of the installation. This report presents the data collected on the Big Rock Point reactor survey. The Big Rock Point reactor site is located in North Central Michigan on the shoreline of Lake Michigan, 4 miles northeast of the community of Charlevoix. Currently operating at the site is a boiling water reactor with a capacity of 75 MW(E) (gross) owned and operated by Consumers Power Company. 6 figs., 3 tabs.

**35036** (EGG–1183-1565) **Snow gaging by airborne radiological surveys, status through September 1972.** Burson, Z.G.; Fritzsche, A.E. EG and G, Inc., Las Vegas, NV (United States). 1 Dec 1972. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018213. Source: OSTI; NTIS; GPO Dep.

The real average of water equivalent of snow cover can be measured to an accuracy of $\pm$ 0.9 g/cm$^2$ or 6%, whichever is greater, using airborne radiation measurements of the natural gamma radiation emanating from the soil. The current state-of-the-art of this research program and the hydrologic interpretation are close to operational status. Both a gross count (counting of all photons) and a peak area (counts under the photopeak in the gamma energy spectrum) method are used. Improvements in both accuracy and spatial resolution should result from using a dual detector system

in which one detector preferentially "looks" up. to account for the airborne radiation daughter contributions. 16 refs.. 13 figs., 3 tabs.

**35037** (EGG–1183-1569) **Radiological survey of the area surrounding the Project GNOME Test Site, Carlsbad, New Mexico: Date of survey: 13 May 1972.** EG and G, Inc., Las Vegas, NV (United States). 14 Feb 1973. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018212. Source: OSTI; NTIS: GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to perform an aerial radiological survey of the Project Gnome Test Site and surrounding area during May 1972. The survey measured terrestrial background gamma radiation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a four square mile area showing gamma exposure rates three feet above the ground. Results in general indicated the presence of isotopes normally found in the background radiation throughout the United States. However, trace amounts of cesium-137 were detected over a small area, later identified as a waste dump. 2 refs., 5 figs., 2 tabs.

**35038** (EGG–1183-1570) **Radiological survey of the area surrounding the Monticello Nuclear Generating Plant, Monticello, Minnesota: Date of survey: 21, 22 August 1970.** EG and G, Inc., Las Vegas, NV (United States). 14 Feb 1973. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018209. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to survey the Monticello Nuclear Generating Plant and surrounding area during August 1970. The survey measured terrestrial background gamma radiation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 625 square mile area showing isoexposure contours three feet above the ground. Results indicated the presence of isotopes normally found in the background radiation throughout the United States. 3 refs., 3 figs., 3 tabs.

**35039** (EGG–1183-1571) **Radiological survey of the area surrounding the Enrico Fermi Atomic Power Plant, Monroe, Michigan: Date of survey: 1 September 1970.** EG and G, Inc., Las Vegas, NV (United States). 23 Feb 1973. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018210. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to survey the Enrico Fermi Atomic Power Plant and surrounding area during September 1970. The survey measured terrestrial background gamma radiation and included a plume track of the stack release gases. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 277 square mile area showing isoexposure contours three feet above the ground. Results indicated the presence of isotopes normally found in the background radiation throughout the United States. The plume track revealed no radiation above background levels. 3 refs., 3 figs., 3 tabs.

**35040** (EGG–1183-1573) **Radiological survey of the area surrounding the Shippingport Atomic Power Station Shippingport, Pennsylvania: Date of survey: 24 February 1973.** EG and G, Inc., Las Vegas, NV (United States). 9 Mar 1973. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018211. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to survey to Shippingport Atomic Power Station and surrounding area on February 24, 1973. The survey measured terrestrial background gamma radiation. Shippingport Station, operated by the Atomic Energy Commission and the Duquesne Light Company, is located near Shippingport, Pennsylvania. The size of the survey area was 530 square miles. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 530 square mile area showing isoexposure contours three feet above the ground. Results indicated the presence of isotopes normally found in the background radiation throughout the United States. 4 refs.. 3 figs.. 3 tabs.

**35041** (EGG–1183-1578) **HAVE SINEW-1 recovery operation, August 1971.** EG and G. Inc.. Las Vegas, NV (United States). 16 Mar 1973. 10p. Sponsored by USDOE. Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018207. Source: OSTI; NTIS: GPO Dep.

The Aerial Radiological Measuring System (ARMS) participated during August 1971 in Project HAVE SINEW-1 at White Sands Missile Range. New Mexico. This project involved the flight of an Air Force Athena rocket carrying payloads which fell on the White Sands Range. The six payload packages contained a total of nine radioactive gamma sources as aids to recovery. The ARMS objective was to locate the sources from the air and to direct recovery crews to the impact sites. By means of the gamma detection equipment on board the ARMS aircraft. seven of the nine sources were quickly located. Of these, five were still attached to intact payload packages as expected; the other two were found detached from third payload. The remaining two sources were not found. It is believed that the payload(s) carrying the mission sources broke up in flight, causing them to fall uprange of the search area. 5 figs.

**35042** (EGG–1183-1586) **Radiological survey of the area surrounding the Nuclear Reactor Testing Station, Idaho Falls, Idaho: Date of survey: 1 and 2 February 1972.** EG and G, Inc., Las Vegas. NV (United States). 13 Apr 1973. 15p. Sponsored by USDOE, Washington. DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018208. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to survey the Nuclear Reactor Testing Station (NRTS) during February 1972. The purpose of the survey was primarily to identify the presence of Ru-106 ad Rh-106 from a suspected leak from the Central Processing Plan at NRTS. Additionally, the gamma-ray terrestrial exposure rate levels were to be mapped and the distribution of any man-made isotopes located and defined. The high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer-processed into a ma of a 330-sq-mi. area showing gamma isoexposure contours 3 ft above the ground. Exposure rates greater than natural terrestrial background radiation were found in the area surrounding reactor sites, waste dumps and the Chemical Processing Plant (CPP). The increased exposure rates appear to be caused by old fission products and some radioactive gases, possibly Ar-41, from normal reactor operations. The presence of Ru-106 and Rh-106 was not detected, indicating minimal leakage, if any, from the CPP. 2 refs., 5 figs., 2 tabs.

**35043** (EGG–1183-1594) **Radiological survey of the area surrounding the Haddam Neck Plant, Haddam Neck, Connecticut: Date of survey: 27, 28 August 1969.** EG and G, Inc., Las Vegas, NV (United States). 11 May 1973. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018206. Source: OSTI; NTIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to survey the area surrounding the Haddam Neck nuclear power plant (Connecticut Yankee Reactor) during August 1969. The survey measured terrestrial gamma radiation. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer-processed into a map of a 900-square-mile area showing isoexposure contours three feet above the ground. Exposure rates and isotopes identified are consistent with normal terrestrial background radiation. 3 refs., 4 figs., 3 tabs.

**35044** (EGG–1183-1624) **Radiological survey of the McGuire Bomarc Site, New Jersey: Date of survey: November 1973.** EG and G, Inc., Las Vegas, NV (United States). 4 Mar 1974. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018195. Source: OSTI; NTIS; INIS; GPO Dep.

On November 12, 13 and 14, 1973, an aerial radiation survey was flown over a US Air Force deactivated Bomarc missile site near McGuire Air Force Base, New Jersey. The purpose of the

survey was to map $^{241}Am$ associated with weapons grade plutonium within and immediately adjacent to the site. Presence of the $^{241}Am$ was the result of a fire in one of the bunkers, which occurred in 1960. The aerial survey was conducted by EG&G, Inc., a contractor to the United States Atomic Energy Commission (AEC), Division of Operational Safety, at the request of the United States Air Force, Office of the Surgeon General. This equipment and contractor team are part of a special capability recently developed within the AEC Division of Military Applications, to rapidly evaluate radiological contamination in areas affected as the result of a Broken-Arrow situation. Standard military helicopters, with military pilots, provide the aerial platform. Installation of equipment requires a few hours under supervision of the contractor team. The spatial distribution of the $^{241}Am$ contamination on the terrain surface was measured using a large array of NaI gamma ray detectors, mounted on a helicopter. The data was acquired utilizing the REDAR (Radiation and Environmental Data Acquisition and Recorder) system. It was processed on the REDAC (Radiation and Environmental Data Analyzer and Computer) system. Measurements of both gamma ray count rate and energy spectra were made and correlated with the helicopter position data. Results are presented as isopleths giving the $^{241}Am$ surface concentration in units of $\mu g/m^2$. Measured values varied from background levels (< 0.04 $\mu g/m^2$ to between 0.43 $\mu g/m^2$ and 0.81 $\mu g/m^2$). Additionally, gamma energy spectra and intensity variations over the affected areas are presented. 16 figs., 1 tab.

**35045** (EGG–1183-1646) **Radiological survey of the area surrounding the H. B. Robinson S. E. Plant, Hartsville, South Carolina: Date of survey: 19–21 May 1973.** EG and G, Inc., Las Vegas, NV (United States). 4 Nov 1974. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018204. Source: OSTI; NTIS; INIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to perform an aerial radiological survey of the area surrounding the H.B. Robinson S.E. Plant Reactor on 19 through 21 May 1973. The terrestrial background gamma radiation was measured during the survey. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 625-square-mile area showing isopleths of the (3 ft above ground) gamma exposure rate. Results indicated the presence of natural radioelements normally found in the surface soil throughout the United States. Measured gamma exposure rates were mostly in the 4 to 8 $\mu$R/hr range, with maximum of 13 $\mu$R/hr. Ground based validation measurements, including in-situ radiological measurements and soil sample analysis, were made at three selected locations, confirming the presence of trace amounts of $^{137}Cs$ from worldwide fallout. Analysis of the surface soil geology is discussed relative to a correlation between the natural radioelement concentrations and the measured radioactivity. 18 refs., 5 figs., 6 tabs.

**35046** (EGG–1183-1647) **Radiological survey of the area surrounding the Brown's Ferry Nuclear Power Plant, Decatur, Alabama: Date of survey: 25 and 26 May 1973.** EG and G, Inc., Las Vegas, NV (United States). 5 Nov 1974. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018203. Source: OSTI; NTIS; INIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to perform an aerial radiological survey of the area surrounding the Brown's Ferry Nuclear Power Plant on May 25 and 26, 1973. The terrestrial background gamma radiation was measured during the survey. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 625-square-mile area showing isopleths of the (3 ft above ground) gamma exposure rate. Results indicated the presence of natural radioelements normally found in the surface soil throughout the United States. Measured gamma exposure rates were mostly in the 4 to 9 $\mu$R/hr range, with a maximum of 12 $\mu$R/hr. Ground based validation measurements, including in-situ radiological measurements and soil sample analysis, were made at two selected locations, confirming the presence of trace amounts of $^{137}Cs$ from worldwide fallout. Analysis of the surface soil geology is discussed relative to a correlation between the natural radioelement concentrations and the measured radioactivity. 20 refs., 5 figs., 6 tabs.

**35047** (EGG–1183-1649) **Radiological survey of the area surrounding the Calvert Cliffs Nuclear Power Plant, Lusby, Maryland: Date of survey: 8 and 9 June 1973.** EG and G, Inc., Las Vegas, NV (United States). Jul 1976. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018193. Source: OSTI; NTIS; INIS; GPO Dep.

The Aerial Radiological Measuring System (ARMS) was used to perform an aerial radiological survey of the area surrounding the Calvert Cliffs Nuclear Power Plant during June 8 and 9, 1973. The terrestrial background gamma radiation was measured during the survey. A high-sensitivity detection system collected gamma-ray spectral and gross-count data. The data were then computer processed into a map of a 512- square-mile area showing isopleths of the (3 ft above ground) gamma exposure rate. Results indicated the presence of natural radioelements normally found in the surface soil throughout the United States. Measured gamma exposure rates were mostly in the 2 to 8 $\mu$R/hr range, with a maximum of 13 $\mu$R/hr. Analysis of the surface soil geology is discussed relative to a correlation between the natural radioelement concentrations and the measured radioactivity. 7 refs., 5 figs., 3 tabs.

**35048** (EGG–1183-1657) **An aerial radiological survey of the area surrounding the Dresden Nuclear Power Plant, Morris, Illinois: Date of survey: September 1972.** Boyns, P.K. EG and G, Inc., Las Vegas, NV (United States). Jun 1978. 27p. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018201. Source: OSTI; NTIS; INIS; GPO Dep.

The Aerial Measuring Systems (AMS) * was used to survey the area surrounding the Dresden Nuclear Power Plant during September 1972. The survey measured terrestrial gamma-ray exposure rate and spectral data. A high-sensitivity detection system collected gamma-ray spectral and gross count data. The data were then processed to construct a map of a 625 square mile area showing the spatial distribution of gamma-ray exposure rates 1 m above the ground. Exposure rates and isctopes identified are consistent with that related to normal terrestrial background radiation. The Dresden area was surveyed in 1968 and 1970. Comparison of the 1968 and 1970 surveys shows no measurable change in the terrestrial gamma exposure rates. Comparison of the 1968 ad 1970 surveys indicates a slight decrease in the average terrestrial exposure rate. 9 refs., 9 figs., 4 tabs.

**35049** (EGG–1183-1698) **Aerial radiological survey of the D.C. Cook Nuclear Plant (Bridgman, Michigan): Date of survey: September 1975.** EG and G, Inc., Las Vegas, NV (United States). Sep 1976. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018200. Source: OSTI; NTIS; INIS; GPO Dep.

An airborne radiological survey of an 1100 $km^2$ area surrounding the Donald C. Cook Reactor site was made between September 3 and September 6, 1975. Detected radioisotopes and their associated gamma ray exposures rates were consistent with that expected from the normal background emitters. Areal average exposure rates equivalent to one meter above the ground are presented in the form of an isopleth map. Exposure rates measured with small portable instruments and soil sample analysis showed excellent agreement with the airborne data. Geological data are presented in an isopleth map of rock and soil types; a brief description of the vegetation and terrain surrounding the site is also included. 8 refs., 4 figs., 2 tabs.

**35050** (EGG–1183-1708) **An aerial radiological survey of the area surrounding the Palisades Plant Nuclear Reactor Site (South Haven, Michigan): Date of survey: June 1976.** Boyns, P.K. EG and G, Inc., Las Vegas, NV (United States). Mar 1977. 15p. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States).

DOE Contract AC08-76NV01183. Order Number DE91018199. Source: OSTI; NTIS; INIS; GPO Dep.

An airborne radiological survey of an 1073 $km^2$ area surrounding the Palisades Plant nuclear reactor site was made on June 25, 1976. Detected radioisotopes and their associated gamma ray exposure rates were consistent with that expected from the normal background emitters. Aerial average exposure rates equivalent to one meter above the ground are presented in the form of an isopleth map. Exposure rates measured with small portable instruments and soil sample analysis showed excellent agreement with with airborne data. Geological data are presented in a map of glacial rock and soil types; a brief description of the terrain surrounding the site is also included. 8 refs., 4 figs., 2 tabs.

**35051** (EGG–1183-1715) **Snow water equivalent survey in the New York–Lake Ontario region: Dates of survey: February 26–March 1, 1977.** Fritzsche, A.E. EG and G, Inc., Las Vegas, NV (United States). Oct 1977. 41p. Sponsored by National Oceanic and Atmospheric Administration, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018198. Source: OSTI; NTIS; GPO Dep.

Thirty flight lines, including about 300 line miles, were flown during February 26, 1977 to March 1, 1977 to measure the water equivalent of snow in the Buffalo, Rochester and Syracuse areas of New York State. The method utilizing the attenuation by snow of natural terrestrial gamma rays was used. Water equivalents from less than one inch, between Rochester and Syracuse, to thirteen inches, east of Lake Ontario, were measured. Concentrated ground based measurements, using snow tubes, near Lake Owasco supported the airborne results. 3 refs., 2 figs., 2 tabs.

**35052** (EGG–1183-1728) **An aerial radiological survey of Argonne Site A, Palos Hills, Illinois: Date of survey: May 1976.** Jobst, J.E.; Houk, J.M.; Mohr, R.A. EG and G, Inc., Las Vegas, NV (United States). Jun 1978. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018197. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey was conducted over the original site of Argonne National Laboratory, viz, Argonne Site A, and over the associated radiological waste dump, Plot M. These areas are 5 km east of the present Laboratory. The survey was performed at an altitude of 30 m on 31 May 1976 using sodium iodide detectors mounted in a helicopter. The 2 $km^2$ aerial survey showed gamma radiation due to naturally occurring radioisotopes in the soil and due to low level concentrations of $^{137}Cs$. Subsequent soil samples showed low levels of tritium and $^{137}Cs$ near Plot M. Soil samples from Site A showed low levels of $^{137}Cs$, $^{60}Co$, and other isotopes. The data was acquired utilizing the REDAR (Radiation and Environmental Data Acquisition and Recorder) system. It was processed on the REDAC (Radiation and Environmental Data Analyzer and Computer) system. This survey was authorzed by the United State of Energy (DOE) and conducted by EG&G. 11 refs., 17 figs., 7 tabs.

**35053** (EGG-M–89238) **Modeling potential migration of petroleum hydrocarbons from a mixed-waste disposal site in the vadose zone.** Rawson, S.A.; Walton, J.C.; Baca, R.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1989]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-8911162–1: NWWA/API conference on petroleum hydrocarbons and organic chemicals in ground water, Houston, TX (United States), 15-17 Nov 1989). Order Number DE91018694. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental monitoring of a mixed-waste disposal site at the Idaho National Engineering Laboratory has confirmed release and migration into the vadose zone of: (1) chlorinated hydrocarbons in the vapor phase and (2) trace levels of certain transuranic elements. The finding has prompted an evaluation of the potential role of waste petroleum hydrocarbons in mediating or influencing contaminant migration from the disposal site. Disposal records indicate that a large volume of machine oil contaminated with transuranic isotopes was disposed at the site along with the chlorinated solvents and other radioactive wastes. A multiphase flow model was used to assess the possible extent of oil and vapor movement through the 177 m thick vadose zone. One dimensional simulations were performed to estimate the vertical distribution of the vapor phase, the aqueous phase, and immiscible free liquid as a function of time. The simulations indicate that the oil may migrate slowly through the vadose zone, to potentially significant depths. Calculated transport rates support the following ranking with regard to relative mobility: vapor phase > aqueous phase > free liquid. 21 refs., 7 figs., 2 tabs.

**35054** (EGG-M–90460) **Influence of natural convection on melt shape during in situ vitrification.** Hawkes, G.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-910739–28: ASME/AIChE/ANS national heat transfer conference, Minneapolis, MN (United States), 26-31 Jul 1991). Order Number DE91018750. Source: OSTI; NTIS; INIS; GPO Dep.

A study of natural convection during In Situ Vitrification (ISV) is presented. ISV is a hazardous waste remediation process in which contaminated soil and/or buried waste is treated in place by direct application of electrical power to the contaminated region via submerged electrodes. The magnitude of the resulting electrical resistance heating is sufficient to cause soil melting. As the molten region grows, natural convection motion of the molten soil occurs. This paper presents numerical results obtained by considering natural convection melting when solving the strongly coupled momentum and energy equations using finite element methods. A local heat source is calculated by solving the electric field equation and calculating a Joule Heat source term. Melt shapes obtained from runs with various values of the coefficient of volume expansion ($\beta$) in the buoyancy terms of the momentum equations are presented. Results of a pure conduction model are also presented. The melt fronts calculated from the fluid flow model melt more uniformly downward, whereas the melt front from the conduction model melts faster in the center and slower near the electrodes. Melt volumes for all models are approximately the same for a specified time period. 3 refs., 11 figs.

**35055** (EGG-WTD–9736) **Particle characterization of contaminated soil.** Miller, J.D.; Hupka, J.; Weidner, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1991. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE91018830. Source: OSTI; NTIS; INIS; GPO Dep.

Samples collected from Test Reactor Area Warm Waste Pond sediments at the Idaho National Engineering Laboratory were characterized in the test facilities in the Metallurgy Department, University of Utah. The sediments were characterized in terms of several physical, chemical, and mineralogical properties judged to be most important for separating radioactive materials and hazardous metals from the sediment matrix. The properties include particle size, distribution, effects of heating at 600°C, electrophoretic properties, magnetic separation, acid leaching, and analyses using ultra-violet light, infra-red, and x-ray diffraction. The results show that most radioactive and hazardous metals are present in the $\leq$ 150 micron size fraction and that 80% of the sediments occur in the $\geq$ 150 micron size fraction. No significant concentration of hazardous metals was found to be related to magnetic properties. Organic matter, probably as a thin film, was shown to be present. The mineralogy of the samples include quartz, chlorite, kaolinite, illite, calcite, and dolomite. 3 refs., 17 figs., 5 tabs.

**35056** (EGG-WTD–9749) **Characterization studies on: (A) Contaminated batch of Rocky Flats soil (B) Uncontaminted batch of INEL soil.** Lee, Jae-Ho; Martins, G.P.; Weldner, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1991. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE91018785. Source: OSTI; NTIS; INIS; GPO Dep.

Transuranic waste (TRU) contaminated soil samples collected near Rocky Flats 903 Pad and uncontaminated INEL soil collected from the Lost River spreading area A adjacent to the Radioactive Waste Management Complex were characterized in the analytical facilities of the Department of Metallurgical and Materials Engineering, Colorado School of Mines. The soils were characterized in terms of chemical, physical and mineralogical properties judged to be important for separating hazardous materials from the soil matrix. These properties include particle size distribution, density

measurements, determination of micro-morphology, micro-chemical analysis, cation exchange capacity, and mineralogical and chemical analysis. The results indicate that the two soils are distinctly different from one another, but share some features. Rocky Flats soils contain about 47 wt% quartz, 38 wt% clay minerals, 13 wt% feldspars, and minor constituents. INEL soil contains about 37 wt% quartz, 48 wt% clay minerals, 10 wt% calcite, and minor constituents. The cation exchange capacities of each soil are low and are approximately the same when ashed. The radioactivity, relative to unclassified soil, as a function of particle size suggests that TRU metals are concentrated by a factor of approximately 20% in the less than 300 $\mu$m particle size fraction. 29 figs.

**35057** (EUR–13262) **Study of the radionuclides contained in wastes produced by the phosphate industry and their impact on the environment.** Baetsle, L.H. (Centre d'Etude de l'energie nucleaire, Mol (BE)). Commission of the European Communities, Luxembourg (Luxembourg). 1991. 83p. Contract ETCC-0006. Source: OSTI; NTIS (US Sales Only).

This report reviews the present state of the management and disposal of waste associated with mining, milling and reprocessing of phosphate ores with regard to its content on naturally occurring radionuclides. The main areas of investigation are: phosphate ores and their characteristics and phosphate trade in the Member States of the European Community, production and processing methods of phosphoric acids and phosphates, interaction of phosphate products and wastes with the environment, standards and regulations for radioactivity released during processing in the phosphate industry.

**35058** (EUR–13280) **The uranium source-term mineralogy and geochemistry at the Broubster natural analogue site, Caithness.** Milodowski, A.E. (British Geological Survey, Keyworth, (UK)); Pearce, J.M.; Basham, I.R.; Hyslop, E.K. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 50p. Contract FI1W/0073 UK. Source: OSTI; NTIS (US Sales Only).

The British Geological Survey (BGS) has been conducting a co-ordinated research programme at the Broubster natural analogue site in Caithness, north Scotland. This work on a natural radioactive geochemical system has been carried out with the aim of improving our confidence in using predictive models of radionuclide migration in the geosphere. This report is one of a series being produced and it concentrates on the mineralogical characterization of the uranium distribution in the limestone unit considered as the 'source-term' in the natural analogue model.

Chemval is an international project concerned with improving the data used to model the speciation chemistry of radionuclide migration from underground waste disposal sites. Chemval has two main aims: to produce a reliable database of thermodynamic equilibrium constants for use in such chemical modelling; to perform a series of test-case modelling exercises based upon real site and field data to verify and validate the existing tools used for simulating the chemical speciation and the transport of radionuclides in the environment.

**35060** (KFK-PEF–85) **The chemical analysis of undisturbed forest soil cores - methods and results.** Hildebrand, E.E. (Forstliche Versuchs- und Forschungsanstalt Baden-Wuerttemberg, Freiburg im Breisgau (Germany, F.R.). Abt. Bodenkunde und Waldernaehrung). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Jul 1991. 205p. (In German). Contract PEF 87/006/1A. Order Number DE92714349. Source: OSTI; NTIS (US Sales Only).

The structure of forest soils contains chemical information, which is important for tree growth. For this reason empirical methods were developed, which allow to circumvent the homogenisation of soil samples thus avoiding a loss of chemical information. The methods and the additionally obtained information are discussed. (orig.) With 83 figs., 3 tabs., 124 refs.

**35061** (LBL–29689) **Hydrological and geochemical investigations of selenium behavior at Kesterson Reservoir: Annual report, October 1, 1989–September 30, 1990.** Benson, S.M.; Tokunaga, T.K.; Zawislanski, P.; Yee, A.W.; Daggett, J.S.; Oldfather, J.M.; Tsao, L.; Johannis, P.W. Lawrence Berkeley Lab., CA (United States). Oct 1990. 206p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000687. Source: OSTI; NTIS; GPO Dep.

From 1985 to the present we have studied the behavior of selenium in various habitats and environments at Kesterson reservoir, shifting emphasis as remedial actions altered the physical setting. Investigations have evaluated the efficacy of several remedial alternatives, from innovative techniques relying on the complex geochemical behavior of selenium alternatives, from innovative techniques relying on the complex geochemical behavior of selenium in aquatic environments to conventional excavation schemes. Results of these studies supported two cost-effective remedial measures; drain water deliveries were terminated in 1986 and, in 1988, 1 million cubic yards of soil were imported and used to fill the low lying areas of the former Kesterson Reservoir. To date, these two actions appear to have eliminated the aquatic habitat that caused waterfowl death and deformity at Kesterson from the early 1980's to 1987. Biological, surface water and groundwater monitoring data collected by the USBR indicate that Kesterson is now a much safer environment than in past years when drainage water containing 300$\mu$g/l of selenium was delivered to the Reservoir. The continued presence of a large inventory of selenium within the upper portions of unfilled areas of Kesterson Reservoir and immediately below the fill material requires that a continued awareness of the status of this inventory be maintained and improved upon. 83 refs., 130 figs., 19 tabs.

**35062** (LBL–30758) **STMVOC User's Guide.** Falta, R.W.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Jun 1991. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000721. Source: OSTI; NTIS; GPO Dep.

This report contains instructions for using the STMVOC numerical simulator. This code, which was developed at Lawrence Berkeley Laboratory, is an extension of the TOUGH geothermal code for use in problems involving subsurface contamination by nonaqueous phase liquids (NAPLs). The code is used for modeling the non-isothermal transport of air, water, and an organic chemical in three fluid phases. A discussion of the physical processes included in the simulator is given along with a brief outline of the mathematical formulation. A detailed guide to preparing the STMVOC input file with several illustrative examples is provided. 22 refs., 27 figs., 3 tabs.

**35063** (PNL–7787) **Soil washing: A preliminary assessment of its applicability to Hanford.** Gerber, M.A.; Freeman, H.D.; Baker, E.G.; Riemath, W.F. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE91018654. Source: OSTI; NTIS; GPO Dep.

Soil washing is being considered for treating soils at the US Department of Energy's (DOE) Hanford Site. As a result of over 50 years of operations to produce plutonium for the US Department of Defense and research for DOE, soils in areas within the Site are contaminated with hazardous wastes and radionuclides. In the soil washing process, contaminated soil is mixed with a liquid and then physically and/or chemically treated to dissolve the contaminants into solution and/or concentrate them in a small fraction of the soil. The purpose of this procedure is to separate the contaminants from the bulk of the soil. The key to successful application is to match the types of contaminants and soil characteristics with physical-chemical methods that perform well under the existing conditions. The applicability of soil washing to Hanford Site contaminated soils must take into account both the characteristics of the oil and the type of contamination. Hanford soils typically contain up to 90% sand, gravel, and cobbles, which generally are favorable characteristics for soil washing. For example, in soil samples from the north pond in the 300 Area, 80% to 90% of the soil particles were larger

than 250 μm. The principal contaminants in the soil are radionuclides, heavy metals, and nitrate and sulfate salts. For most of the sites, organic contaminants are either not present or are found in very low concentration. 28 refs., 5 figs., 10 tabs.

**35064** (PNL–7790) **Dungeness crab survey for the Southwest Ocean Disposal Site off Grays Harbor, Washington, June 1990.** Higgins, B.J. (Battelle/Marine Sciences Lab., Sequim, WA (United States)); Pearson, W.H. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 37p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92000165. Source: OSTI; NTIS; GPO Dep.

As part of the Grays Harbor Navigation Improvement Project, the Seattle District of the US Army Corps of Engineers has begun active use of the Southwest Ocean Disposal Site off Grays Harbor, Washington. This survey was to verify that the location of the area of high crab density observed during site selection surveys has not shifted into the Southeast Ocean Disposal Site. In June 1990, mean densities of juvenile Dungeness crab were 146 crab/ha within the disposal site and 609 crab/ha outside ad north of the disposal site. At nearshore locations outside the disposal site, juvenile crab density was 3275 crab/ha. Despite the low overall abundance, the spatial distribution of crab was such that the high crab densities in 1990 have remained outside the Southwest Ocean Disposal Site. The survey data have confirmed the appropriateness of the initial selection of the disposal site boundaries and indicated no need to move to the second monitoring tier. 8 refs., 9 figs., 2 tabs.

**35065** (PNL-SA–19469) **Soil washing results for mixed waste pond soils at Hanford.** Gerber, M.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-910981–17: Environmental remediation '91 conference, Pasco, WA (United States), 8-11 Sep 1991). Order Number DE92000147. Source: OSTI; NTIS; INIS; GPO Dep.

Soil washing technology was assessed as a means for remediating soil contaminated with mixed wastes primarily composed of heavy metals and radionuclides. The soils at the US Department of Energy's Hanford Site are considered suitable for soil washing because of their relatively low quantities of silt and clay. However, in a limited number of soil washing experiments using soils from different locations in the north pond of the 300 Area, the degree of decontamination achieved for the coarse fraction of the soil varied considerably. Part of this variation appears to be due to the presence of a discrete layer of contaminated sediment found in some of the samples. 7 refs., 2 figs., 4 tabs.

**35066** (SERI/CP–250-4254-Vol.2, pp. 19-34) **Site considerations for Solar Detoxification Project at LLNL.** Boegel, A.J. (Lawrence Livermore National Lab., CA (USA)); Merrill, T. Solar Energy Research Inst., Golden, CO (United States); Sandia National Labs., Albuquerque, NM (United States). Apr 1991. (CONF-9103109–Vol.2: SOLTECH '91 conference, Burlingame, CA (United States), 26-29 Mar 1991). In *SOLTECH 91: Proceedings. Volume 2*. 317p. Order Number DE91013767. Source: OSTI; NTIS.

Solar technology for environmental applications has been studied under laboratory conditions by many groups. However, an actual contaminated site has many characteristics that can complicate any cleanup operation and must be adequately addressed here before commercialization is possible. These characteristics include the amount and type of contamination, the regulatory requirements, and the effects of other ground water constituents. The laboratory results need to be compared with field results using the same equipment. The Solar Detoxification Project at LLNL is a collaborative effort by three national laboratories [Solar Energy Research Institute (SERI), Sandia National Laboratory (SNL), and Lawrence Livermore National Laboratory (LLNL)] to take this solar technology out of the laboratory and into the field to detoxify contaminated ground water under actual field conditions. LLNL is the site of this experiment for many reasons. It is a Superfund site already well-characterized. The experiment can be included under existing permits. The existence of permitted LLNL ground water treatment systems makes it possible to perform a technology evaluation of this magnitude. The experimental solar detox facility will be installed in series with an existing permitted treatment facility such that any contaminants remaining in the ground water following detoxification experiments with the solar unit will then be treated by the LLNL facility. LLNL has experience with and has evaluated several related treatment technologies. The project will provide an opportunity for broad experimentation on system variables that will lead to improved system designs and techniques for contaminated ground water remediation.

**35067** (VTT-TIED–1212) **Cost-efficiency of measures to reduce sulphur deposition.** Lehtilae, A. (Valtion Teknillinen Tutkimuskeskus, Otaniemi (Finland). Ydinvoimatekniikan Lab.); Savolainen, I.; Tuovinen, J.P. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Jan 1991. 49p. (In Finnish). Order Number DE92704018. Source: OSTI; NTIS (US Sales Only).

In the calculation scheme the transport of sulphur emissions has been estimated by using two models. For longer distances the results of the EMEP long-range transport model have been applied, whereas for shorter distances the mesoscale deposition model developed by the Finnish Meteorological Institute has been adopted. The amount of background deposition originating from either natural sources or from unidentifiable human sources (coming from or going through non-European areas) has been carefully judged. The cost data used in the calculations include the estimated costs of two different emission reduction technologies as well as the costs of fuel switching for each large scale energy conversion plant in Finland. Furthermore, the costs for reducing process emissions from the major $SO_2$-emitting industrial sectors have been rough calculated. For each of the Finnish provinces and the nearby Soviet regions cost functions of emission reductions have been constructed. Cost functions for other European countries have been obtained from the IIASA (International Institute for Applied Systems Analysis) Rains model. The results of the calculations indicate that even if the most cost-effective measures can be taken in southern Finland and in Kola, soon measures in other Soviet nearby regions should be considered having a high priority, too. Significant reductions in deposition levels can, however, be achieved only through marked abatement of emissions in central and eastern Europe.

**35068** (VYH-JULK–A66) **The use of chlorinated paraffins and their possible effects in the environment.** Mukherjee, A.B. National Board of Waters and the Environment, Helsinki (Finland). 1990. 56p. Order Number DE92703993. Source: OSTI; NTIS (US Sales Only).

This survey is an overview of the current state of knowledge in Finland concerning chlorinated paraffins (CPs). Commercially, more than 200 types of CPs have been reported. The carbon chain length and chlorine percentage varies in the different types of CPs. Due to their favourable properties, CPs have a multitude applications. CFs are not produced in Finland but they are imported. In 1988 about 840 tons were consumed by paper, plastic, paint and metal industries in Finland. Due to lack-of an adequate analytical method, the route of CPs to the Finnish environment is still unknown. It is believed that due to their low water solubility, CPs are bound to products or end up at landfills. Because only minor quantities of CPs are transported to waste incineration plants or steel industry as scrap metal, emissions formed in these processes are insignificant. The toxicity of CPs depends on carbon chain length and the degree of chlorination. By certain standard tests, carcinogenesis of CPs has been indicated.

**35069** (VYH-JULK–A67) **Environmental impacts of hazardous wastes in landfills.** Assmuth, T.; Poutanen, H.; Strandberg, T.; Melanen, M.; Penttilae, S.; Kirsti, K. National Board of Waters and the Environment, Helsinki (Finland). 1990. 214p. (In Finnish). Order Number DE92703995. Source: OSTI; NTIS (US Sales Only).

The environmental impacts and risks caused by hazardous wastes disposed in Finnish landfills were assessed on the basis of a five year field study of 43 landfills. The experimental investigations were concentrated on the chemical quality and toxicity of surface water runoff from municipal solid waste landfills. Additionally, measurements have been made of the quality of waste deposits, landfill gas, ground water and soil. The main results of the research are presented and thoroughly discussed in this report, e g. by comparing them with published reference data. General conclusions are drawn on the basis of the analyses concerning the

environmental impacts and risks of hazardous wastes in Finnish landfills, and recommendations are given for their assessment and management.

35070 (WHC-SA-1289) **A comparison of three methods for solving flow equations of two immiscible fluids in variably saturated media.** Piepho, M.G. (Westinghouse Hanford Co., Richland, WA (United States)); Runchal, A.K. Westinghouse Hanford Co., Richland, WA (United States). Jul 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-911244-1: 3. symposium on multiphase transport in porous media. Atlanta, GA (United States), 1-6 Dec 1991). Order Number DE91016945. Source: OSTI; NTIS; GPO Dep.

Three alternate methods are compared for numerically solving the coupled flow equations for two immiscible fluids in variably saturated media. The three alternate methods are (1) the Picard method, (2) the logmean method, and (3) a modified Picard method. All three methods were used to simulate an experiment with transmission oil infiltrating sand. Different time-step sizes were used for each method, and mass-balance accuracy is compared for each time-step size and method at various time values during the transient infiltration. Also, simulated contours of oil mass, using the modified Picard method, are compared to the experimental contours. 7 refs., 4 figs.

35071 (CIEMAT-641) **Temporal distribution of Pu and Am in the marine environment of southern coast of Spain.** Iranzo, E.; Gascon, C.; Romero, L.; Martinez, M.; Mingarro, E.; Rivas, P. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1989. 43p. Order Number DE92700002. Source: OSTI; NTIS (US Sales Only).

The distribution of trasuranides and Cs-137 in selected sediment cores from southern Spanish coast has been studied. The area is of special interest as an accidental release of transuranides (four nuclear bombs fallen down) occured near the seaside in 1966 (Palomares). The possible transference to the coast by the river (contaminated by one bomb, surface contamination: 12-120 alpha Bq/m2) or by aerosol produced in the explosion had never been estudied. Several sediments cores between Cape of Palos ands Cape of Gata and surface sediments were raised. The profiles of transuranides distribution were determined and were dated in order to determine the year of the contributions. An enhanced concentration of transuranides has been observed at southern area of Palomares coast, the causes of this phenomena have been analyzed in this paper. The accuracy of radiochemical analysis was checked by analyzing standard material and duplicated samples. (Author)

35072 (CONF-9010383-1) **Mercury in aquatic ecosystems.** Blaylock, B.G. Oak Ridge National Lab., TN (United States). [1990]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From BIOMOVS (biosperic model validation study) symposium on the validity of environmental transfer models; Stockholm (Sweden); 8-10 Oct 1990. Order Number DE91018844. Source: OSTI; NTIS; GPO Dep.

This document contains the introduction and conclusions from the talk presented by Gordon Blaylock at BIOMOVS, Proceedings on the Validity of Environmental Transfer Models, held in Stockholm, Sweden in October 1990. This paper provides a broad background for the testing of BIOspheric MOdel Validation Studies (BIOMOVS) models, and discussed three type A models and how their predictions match actual concentrations in the environment. For situations were mercury is near equilibrium, simple models based on distribution coefficients ($K_d$) or concentration factors (both of which are derived from equilibrium values) predict actual concentrations best, but when concentrations are not near equilibrium, these models perform much worse than complex models. Therefore, caution should be used in choosing the model used to analyze specific situations (MHB)

35073 (CONF-910981-9) **A co-metabolic approach to groundwater remediation.** Palumbo, A.V. (Oak Ridge National Lab., TN (United States)); Boerman, P.A.; Strandberg, G.W.; Donaldson, T.L.; Jennings, H.L.; Lucero, A.J.; Herbes, S.E.; Phelps, T.J.; White, D.C. From Environmental remediation '91 conference: Pasco, WA (United States): 8-11 Sep 1991. Order Number DE92000063. Source: OSTI; NTIS; INIS; GPO Dep.

In support of the US Department of Energy's (DOE) Integrated Demonstration (Cleanup of Organics in Soils and Groundwater at Non-arid Sites) at the Savannah River Site (SRS), Oak Ridge National Laboratory (ORNL) and the University of Tennessee (UT) are involved in demonstrations of the use of methanotrophs in bioreactors for remediation of contaminated groundwater. In preparation for a field demonstration at ORNL's K-25 Site in Oak Ridge, Tennessee, ORNL is conducting batch experiments, is operating a number of bench-scale bioreactors, has designed pretreatment systems, and has modified a field-scale bioreactor provided by the Air Force Engineering and Services Center for use at the site. UT is operating bench-scale bioreactors with the goal of determining the stability of a trichloroethylene-degrading methanotrophic consortia during shifts in operating conditions (e.g. pH, nutrient inputs, and contaminant mixtures). These activities are all aimed at providing the knowledge base necessary for successful treatment of contaminated groundwater at the SRS and K-25 sites as well as other DOE sites. 18 refs., 1 fig. , 1 tab.

35074 (CONF-910981-12) **Evaluation of proposed designs for streamflow monitoring structures at waste disposal sites.** Clapp, R.B.; Borders, D.M.; Tardiff, M.F.; Huff, D.D. Oak Ridge National Lab., TN (United States). [1991]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Environmental remediation '91 conference; Pasco, WA (United States); 8-11 Sep 1991. Order Number DE92000064. Source: OSTI; NTIS; GPO Dep.

Design of small surface water monitoring stations associated with waste sites requires an approach that balances several problems. The monitoring site must have a capacity for a wide range of flows, allow accurate measurements over the full performance range, minimize effects from accumulation of contaminated sediments, and minimize costs of construction and operation. Selecting a station design that takes these factors into consideration can be done systematically through use of formal decision analysis. The paper discusses the effectiveness of various hydraulic structures as flumes and weirs to monitor stream flow and drainage. The process has produced the most viable alternative designs and yielded fully documented guidelines for designing new stations as they are needed. 7 refs., 6 figs., 3 tabs.

35075 (DOE/ID-22096) **Hydrologic conditions and distribution of selected chemical constituents in water, Snake River Plain aquifer, Idaho National Engineering Laboratory, Idaho, 1986 to 1988.** Orr, B.R. (Geological Survey, Idaho Falls, ID (United States). Water Resources Div.); Cecil, L.D. Department of Energy, Idaho Falls, ID (United States). Idaho Operations Office; Geological Survey, Idaho Falls, ID (United States). Water Resources Div. Mar 1991. 61p. Sponsored by USDOE, Washington, DC (United States); Department of the Interior, Washington, DC (United States). (USGS-WRI-91-4047). Order Number DE91018691. Source: OSTI; NTIS; INIS; GPO Dep.

Detectable concentrations of radionuclide- and chemical-waste constituents in water from the Snake River Plain aquifer at the Idaho National Engineering Laboratory decreased during 1986–1988. Decreased radionuclide concentrations are attributed to reduced rates of radionuclide-waste disposal, sorption processes, radioactive decay, dilution from recharge, and changes in waste-disposal practices. Tritium concentrations in aquifer water and strontium-90 concentrations decreased. Cobalt-60 and cesium-137 concentrations exceeded the reporting level in water from only one well during 1986–1988. in 1988, concentrations of plutonium-238 and plutonium-239, -240 (undivided) in water from the Test Area

North disposal well were 0.19 ± 0.05 pCi/L and O.96 ± 0.08 pCi/L, respectively. The concentration of plutonium-238 in well CFA-1 was 0.11 ± 0.03 pCi/L in 1987. In subsequent samples, concentrations were less than the reporting level. Sodium, chloride, and nitrate plumes originating from the Idaho Chemical Processing Plant decreased in size since use of the ICPP disposal well was discontinued in 1984. During 1986–1988, the approximate areal extent of the sodium plume decreased from 6.8 to 2.5 square miles, the chloride plume decreased from 17 to 5.2 square miles, and the nitrate plume decreased from 14 to 5 square miles. In 1987, water from wells 65 and 89 contained 280 and 50 μg/L, respectively, of chromium; other water samples contained from less than 1 to 30 μg/L. 52 refs., 17 figs., 3 tabs.

**35076** (DOE/RL–91-47) **Quarterly report of RCRA groundwater monitoring data for period April 1, 1991 through June 30, 1991.** USDOE Richland Operations Office, WA (United States); Westinghouse Hanford Co., Richland, WA (United States). Geosciences Group. Sep 1991. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92000244. Source: OSTI; NTIS; INIS: GPO Dep.

Hanford Site interim-status groundwater monitoring projects are conducted as either background, indicator parameter evaluation, or ground water quality assessment monitoring programs as defined in the Resource Conservation and Recovery Act of 1976 (RCRA); and 40 CFR 265, Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities, as amended (EPA 1989). Compliance with the 40 CFR 265 regulations are required by the Washington Administrative Code 173–303 (Ecology 1991). This submittal provides data obtained from groundwater monitoring activities for April 1, 1991 through June 30, 1991. 12 refs., 1 fig., 12 tabs.

**35077** (ENET–8900424/3) **Temperature of groundwater and plant-growth in Utzenstorf-Aefligen. Short report: Period of investigation 1985-1988.** Borcard, D.; Fluehler, H.; Matthey, W.; Nanz, M.; Oberholzer, M.; Richner, G.; Schwendimann, F.; Werner, A. Bundesamt fuer Energiewirtschaft, Bern (Switzerland). Apr 1989. 59p. (In German). Order Number DE92714225. Source: OSTI; NTIS (US Sales Only); ENET, Elfenauweg 29, CH-3006 Bern (CH).

This report deals with the effects of the cooling of the groundwater, caused by heat pumps, on plant-growth. There is no effect where the groundwater table is deep but the situation has not yet been clarified where the groundwater table is high. The dependency between ground and groundwater temperatures was investigated in extensive field experiments. The nine locations where experiments were carried out included 6 agricultural areas and 3 forest areas. At five of the locations the distance between the surface and the groundwater table was smaller than 1.5 m, therefore the root area was close to the groundwater table. At 4 locations the groundwater table was 3.6 m underground. Different results were achieved, the most important one being that no indication was found that the cooling of the groundwater jeopardises the agricultural yields, if the groundwater table lies below the root area, i.e. depending on the soil conditions ca. 2 m below the surface of the ground. 25 figs., 5 tabs., 5 refs.

**35078** (ETDE-mf–2704574) **Program of the Land of Hessen for surface water quality assessment. Flowing water. Measurements and evaluations 1989.** Umweltplanung, Arbeits- und Umweltschutz. Fesel, U.; Rosen, G. Hessische Landesanstalt fuer Umwelt, Wiesbaden (Germany). 1990 277p. (In German). Order Number DE92704574. Source: OSTI; NTIS (US Sales Only).

In the framework of the Hessen surface water quality measuring program, 57 measuring stations were installed in flowing bodies of water. Chemical and physical analyses of water samples from these points were carried out at regular intervals in order to assess the water quality. The results are compiled, evaluated, and compared with the findings of earlier years in this report. (BBR).

**35079** (KFK–4869) **Environmental research in the former GDR in the 80ies and promotion measures following German unification.** Coenen, R.; Schmitt, J.J. Kernforschungszentrum Karlsruhe GmbH (Germany). Abt. fuer Angewandte Systemanalyse. May 1991. 23p. (In German). Order Number DE92714343. Source: OSTI; NTIS (US Sales Only).

A brief description of the deficits in environmental policy and of the, in parts, catastrophic environmental pollution situation in the former GDR, is followed by an analysis of the GDR's promotion of environmental research during the 80ies. The analysis of research statistics highlights the completely inadequate promotion given to the environmental field. The report continues with a description of the measures to promote environmental research following German unification. (orig.).

**35080** (NIRS-RSD–92) **Radioactivity survey data in Japan, part 1. Environmental materials.** National Inst. of Radiological Sciences, Chiba (Japan). Apr 1991. 32p. Order Number DE92704017. Source: OSTI; NTIS (US Sales Only); INIS.

The publication is aimed at providing radioactivity survey data in environmental and dietary materials in Japan. Part 1 covers environmental materials, consisting of rain and dry fallout, airborne dust, service water, freshwater, soil, sea water, and sea sediments. Samples were collected from 42 sampling locations during the period between July 1989 and July 1990, and were sent to the Japan Chemical Analysis Center for radiochemical analysis. Strontium 90 and cesium 137 in these environmental materials are tabulated. The maximum concentrations of strontium-90 and cesium-137 were as follows: 0.17+-0.100 MBq/Km$^2$ and 0.30+-0.030 MBq/Km$^2$, respectively, for rain and dry fallout (domestic program); 0.16+-0.031 MBq/Km$^2$ and 0.31+-0.031 MBq/Km$^2$ for rain and dry fallout (WHO program); 0.003+-0.0017 mBq/m$^3$ and 0.005+-0.0012 mBq/m$^3$ for airborne dust; 4.9+-0.29 mBq/l and 0.6+-0.11 mBq/l for service water; 5.0+-0.26 mBq/l and 0.5+-0.10 mBq/l for freshwater; and 18+-0.5 Bq/Kg and 110+-1.0 Bq/Kg for dried soil. Yearly changes in the concentrations of both strontium-90 and cesium-137 from 1986 through 1990 are given in figures. (J.P.N.).

**35081** (ORNL/ER–17) **Treatability study for WAG 6 (SWSA 6) trench water.** Taylor, P.A. Oak Ridge National Lab., TN (United States). Aug 1991. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000418. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Program at Oak Ridge National Laboratory (ORNL) is examining methods for remediation and final closure of Waste Area Grouping 6 (WAG 6) under a Resource Conservation and Recovery Act (RCRA) closure plan. WAG 6 consists primarily of Solid Waste Storage Area 6 (SWSA 6), where solid low- level radioactive waste (and some hazardous waste) was buried from 1968 to 1985 in shallow trenches. To support the feasibility study that is being prepared for closure of WAG 6, lab-scale treatability tests were performed on the water from selected trenches in SWSA 6 to determine if the trench water could be treated at the existing wastewater treatment plants at ORNL. Water from 23 of the 500 trenches in SWSA 6 has been sampled and analyzed to date, and the 4 most highly contaminated trenches identified thus far supplied the water used in the treatability tests. The softening and ion-exchange processes used in the Process Wastewater Treatment Plant (PWTP) reduced the $^{90}$Sr concentration, which was the only radionuclide present in the trench water at above the discharge limits, from 260 to 0.2 Bq/L. The air stripping and activated carbon adsorption processes used in the Nonradiological Wastewater Treatment Plant (NRWTP) removed volatile and semivolatile organics (mostly toluene, xylene, and naphthalene), which were the main contaminants in the trench water, to below detection limits. The trench water treated in the lab-scale equipment easily met all discharge limits for the PWTP and the NRWTP. 6 refs., 2 figs., 9 tabs.

**35082** (ORNL/M–1156) **Environmental surveillance data report for the third quarter of 1990.** Goldberg, P.Y.; Osborne-Lee, A.E.; Powell, M.R.; Stevens, M.M.; Tardiff. M.F.; Valentine, C.K.; Wolf, D.A. Oak Ridge National Lab., TN (United States). Jul 1991. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000422. Source: OSTI; NTIS; GPO Dep.

Each section of this report consists of a program description; results for the quarter: and an analysis of trends over the previous two years, depending upon the availability of data. The analyst who produced each section is identified in order to facilitate the reader in following up any questions regarding the data or the analysis approach. The reader is directed to the trend subsections

for more in-depth summaries of each data section.The four major environmental topics included are air, water, meteorological processes and biological monitoring. 16 figs., 34 tabs.

**35083** (PNL-SA-19646) **Bioremediation of Hanford groundwater.** Brouns, T.M.; Anderson, D.B.; Fredrickson, J.K.; Luttrell, S.P.; Skeen, R.S.; Workman, D.J. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-910981-25: Environmental remediation '91 conference, Pasco, WA (United States), 8-11 Sep 1991). Order Number DE92000799. Source: OSTI; NTIS; INIS; GPO Dep.

Liquid wastes containing radioactive, hazardous, and regulated chemicals have been generated throughout the 40 years of operations at the US Department of Energy's (DOE) Hanford Site. Some of these wastes were discharged to the soil column and many of the waste components, including nitrate ($NO_3$), carbon tetrachloride ($CCl_4$), and several radionuclides, have been detected in the Hanford groundwater. Current DOE policy prohibits the disposal of contaminated liquids directly to the environment, and remediation of existing contaminated groundwaters may be required. A research and development program is underway to develop bioremediation technologies for both ex situ and in situ groundwater treatment. 16 refs., 2 figs., 3 tabs.

**35084** (RFP-4500) **Pond water analysis summary.** Bauer, J.F.; Weier, D.R. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 21 Jan 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE91018962. Source: OSTI; NTIS; GPO Dep.

This report contains a summary of statistical analyses performed on radionuclide data for the Environmental Restoration/Clean Water Act group. While some differences in levels of radionuclides at the various sampling locations are shown, many times they are not different from the plant raw water supply. The impact of repeatedly applying standards which approximate 93rd percentiles will result in exceeding such standards on a regular basis. Reaction to exceeding such standards should take this into consideration. The observed differences in the uncertainty levels for plutonium concentrations is most likely due to the difference in the plutonium level measured. The filter socks in the current water treatment process have been ineffective in reducing the gross alpha and gross beta levels. 7 tabs.

**35085** (RLO-2227-T12-47) **Radioactive zinc ($^{65}$Zn), zinc, cadmium, and mercury in the Pacific Hake, Merluccius productus (Ayres), off the West Coast of the United States.** Naidu, J.R. Oregon State Univ., Corvallis, OR (United States). Jun 1974. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT06-76EV72012. Order Number DE92000516. Source: OSTI; NTIS; GPO Dep.

The Pacific Hake, Merluccius productus (Ayers) was used to monitor the waters off Puget Sound and the West Coast of the US for zinc(Zn), cadmium(Cd), mercury(Hg) and $^{65}$Zn. The Columbia River is not the source of Zn, Cd or Hg contamination, but is the source of $^{65}$Zn, with the concentration in the Hake reflecting the position of the Columbia River plume. Zn and Cd accumulation in the Hake were fit to the equation $Y=B_1+B_2e^{B}{}_3X$ where Y is the concentration of the element and X is the length or weight of the fish. Biological attributes were assigned to the other parameters as follows: $B_1$ is the asymptotic value for Zn or Cd at chemical maturity; $B_2$ is the location of the curve with respect to the length or weight of the fish; and $B_3$ is a constant pertaining to the rate of change of Zn or Cd. Although Zn, Cd and Hg are all Group 2B elements, only the concentrations of Zn and Cd were correlated for all locations; Hg concentrations varied as a function of location. Zn and Cd concentrations increase with fish size and approach an asymptotic value at maturity, while Hg concentrations were linear and the slope is a function of sampling location. Zn and Cd levels are regulated in the adult, while Hg continues to increase with age. It may be significant that the age distribution of fish caught commercially coincides with the maximum concentration of Zn and Cd. 195 refs., 30 figs., 10 tabs. (MHB)

**35086** (UCRL-JC-107034) **"Smart" pump and treat.** Isherwood, W. (Lawrence Livermore National Lab., CA (United States)); Rice, D. Jr.; Ziagos, J.; Nichols, E. Lawrence Livermore National Lab., CA (United States). Sep 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000498. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is approaching the final phase of the Superfund decision-making process for site restoration and will soon initiate full scale cleanup. Despite some well-publicized failings of the pump and treat approach, we have concluded that intelligent application of this strategy if the best choice for ground water restoration at LLNL. Our proposed approach differs sufficiently from the pump and treat methods implemented at other sites that we call it "smart" pump and treat. Smart pump and treat consists of four distinct, but interrelated, elements: three preremediation strategies and one modification to pump and treat itself. Together, these techniques are an integrated program that utilizes an understanding of crucial aspects of contaminant flow and transport to speed up the remediation of contaminated aquifers. The four elements are: (1) a spatially detailed site characterization, linked with regional hydrogeologic models; (2) directed extraction, where the extraction and recharge locations are controlled by field-determined hydrogeologic parameters; (3) field-validated modeling that the matches the complexity of the collected data; and (4) adaptive pumping, whose pattern varies with time. Together, these techniques minimize the cost and the time to reach regulatory directed cleanup goals and maximize the rate of contaminant removal. 8 refs.

**35087** (UCRL-JC-108064) **Remediation of a gasoline spill by soil vapor extraction, Lawrence Livermore National Laboratory, Livermore, CA.** Cook, G.E. (San Jose State Univ., CA (United States)); Oberdorfer, J.A.; Orloff, S.P. Lawrence Livermore National Lab., CA (United States). Sep 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911185-1: Conference and exposition on petroleum hydrocarbons and organic chemicals in ground water: prevention, detection and restoration, Houston, TX (United States), 20-22 Nov 1991). Order Number DE92000488. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is located approximately 40 miles east of San Francisco in the southeastern portion of the Livermore Valley near Livermore, California. In 1979, an underground gasoline tank was found to be leaking. The spill occurred near Building 403 in the southeast corner of LLNL. The initial investigation confirmed the presence of gasoline contamination in both the soil and ground water. The water table is at a depth of approximately 100 feet. A pilot study on the use of soil vapor extraction in heterogeneous deposits was begun in August 1988. Fieldwork to assess the efficacy of the vapor extraction, including soil sampling and installation of three vadose zone monitoring devices, began in October 1990. 4 refs., 9 figs.

**35088** (VYH-JULK-A49) **The role and uptake of organic matter in lotic ecosystems, part 1, Environmental impacts of nitrogen loading from peat mining, areas in running waters, part 2.** Heikkinen, K.; Visuri, A. National Board of Waters and the Environment, Helsinki (Finland). 1990. 72p. (In Finnish). Order Number DE92704003. Source: OSTI; NTIS (US Sales Only).

Part 1. The literature review deals with the role and uptake of organic matter in lotic ecosystems, with special emphasis paid to the most important groups of biota in organic matter processing, i.e. benthic invertebrates and microorganisms. Part 2. Peat mining has been increasing in the 1970's especially in the drainage basins of the rivers in Osrtobothnia Drainage has resulted in increased inorganic nitrogen mobolization and transport from the peatlands in the area. The most important processes determining the rate of nitrogen transported from peat mining areas in running waters are denitrification, nitrogen binding by detritus decomposing microorganisms and primary producers, and sedimentation of particulate nitrogen and humic substances. The environmental impacts of nitrogen loading are probably greatest during minimum discharge in summer and autumn. It is anyway difficult to estimate the total effects of nitrogen loading from peat mining areas in Finnish rivers, because nitrogen cycling is not well understood.

35089 (VYH-JULK–A58) **The role of nitrogen in overfertilization of costal waters.** Puustinen, J. National Board of Waters and the Environment, Helsinki (Finland). 1990. 86p. (In Finnish). Order Number DE92703989. Source: OSTI; NTIS (US Sales Only).

The results have shown that the role of nitrogen compounds in overfertilization both in Finnish coastal waters as well as in the whole land and in other Baltic sea has not keen researched videly. The results have, however, been notable. The Finnish and Swedish results have shown that, excluding the most loaded coastal waters, the nitrogen acts as limiting nutrient for basic production in the Gulf of Finland and the middle parts of the Baltic sea during a growing season. According to the PELAG-project researching the sea area in front of Hankoniemi, the effect of the other main nutrient phosphor is notably only in the presence of nitrogen, and even then during a short period in the early summer. The key role of nitrogen in overfertilization is highlighted also in the fact that according to the results of the researches of the PELAG-project, the fertilizing effect could be achieved both with inorganic (nitrate and ammonium) and organic (urea) compounds. These observations have shown that the reduction of nitrogen emissions is the main factor in controlling of the overfertilization. E.g. removal of phosphor will not be sufficient, but the amount of nitrogen must also be reduced. Outlining of the task of overfertilization of coastal waters and nitrogen problem also requires determination of total nitrogen load of different sea areas. Most data is required of nitrogen deposition, river loads and direct waste water emissions. There is lack of information also in knowledge of nitrogen binding and denitrification. Denitrification studies of sea water have not been made in Finland. In the future it is important to repeat the researches of the basic production done at present on wider sea areas in Finland. It is also necessary to compile the data obtained from field studies with actual load development. Solving of the nitrogen problem requires also effective cooperation between the countries around the Baltic sea.

35090 (DOE/ER–0511P) **Division of Energy Biosciences annual report and summaries of FY 1991 activities.** USDOE Office of Energy Research, Washington, DC (United States). Energy Biosciences Div. Sep 1991. 114p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92000518. Source: OSTI; NTIS; INIS; GPO Dep.

As a component of the Department of Energy, the Energy Biosciences (EB) program of the Office of Basic Energy Sciences supports long-term research aimed at addressing energy-related problems utilizing biological systems. There are three main components of the EB program. The first, Primary Biological Energy Conversion, concentrates on research on plant and microbial photosynthesis, but also deals with plant growth control, stress reactions, and interaction with pathogens. The second, Bioconversion of Products, concentrates on utilization of the products of primary energy conversion. Specific examples include biosynthesis of potential fuels or chemicals, biodegradation of lignocellulose into potentially useful compounds, plant/microbe symbiosis, microbial methanogenesis and fermentation. The third main component of the EB program involves providing the basic research infrastructure to support future discoveries. The emphasis here is on investigation of basic genetic mechanisms, both in novel systems and extensively studied systems such as maize; development of critical databases, techniques, and instrumentation; and support of training in areas that are important but underpopulated. Brief descriptions of currently supported research projects are provided. 186 refs., 1 tab (MHB)

35091 (DOE/ER/13968–T3) **Mechanism for the selective conjugation of ubiquitin to phytochrome: Progress report for 1990.** Vierstra, R.D. Wisconsin Univ., Madison, WI (United States). Dept. of Horticulture. [1990]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13968. Order Number DE92000019. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to understand at the molecular level how phytochrome functions and how intracellular proteins are degraded. Phytochrome is marked for degradation by covalent attachment of ubiquitin. Ubiquitin-phytochrome conjugates (UbP) were characterized with respect to formation kinetics, subcellular localization and site of ubiquitin attachment. UbP appears to be a general phenomenon during phytochrome degradation in a variety of species. UbP was isolated from oat seedlings and characterized. Residues 747-830 of phytochrome have been identified as a possible attachment site for ubiquitin. By placing the gene for etiolated phytochrome in tobacco we have created a transgenic system for over expressing phytochrome. The effects of this over expression are described, and it appears that tobacco degrades this foreign protein through formation of UbP. We have created a series of site-directed mutants of the oat phytochrome gene, and are in the process of characterizing them to determine sequence requirements for ubiquination. 8 refs., 1 fig. (MHB)

35092 (DOE/ER/14054–2) **Nuclear genes encoding plastid proteins expressed early in chloroplast development: Progress report.** Mullet, J.E. Texas A and M Univ., College Station, TX (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER14054. Order Number DE91018533. Source: OSTI; NTIS; GPO Dep.

The overall objective of this grant was to characterize events which occur early in chloroplast biogenesis and to isolate nuclear genes encoding plastid proteins which are expressed during this developmental phase. In addition, the possible requirement of plastid transcription for the expression of the nuclear genes such as rbcS and cab was to be tested. The impetus for this research came from studies of chloroplast biogenesis in barley. We found that plastid DNA copy number was relatively high (120 copies/plastid vs 200 at maximal accumulation) in the meristematic region of the leaf base whereas plastid transcription activity was low in this plastid population. Later in chloroplast development transcription activity increased at least 5 fold per plastid or per template indicating that activation of plastid transcription occurred after most of the build up in plastid DNA per plastid. This suggested that activation of plastid DNA synthesis occurred early in chloroplast development and that nuclear genes involved in this activity must be regulated differently from genes such rbcS or cab which are expressed later in development. 3 refs., 7 figs.

35093 (DOE/ER/60636–T4) **Genes and gene expression: Localization, damage and control – A multilevel and interdisciplinary study: Progress report, February 1, 1991–January 31, 1992.** Ts'o, P.O.P. Johns Hopkins Univ., Baltimore, MD (United States). School of Hygiene and Public Health. Sep 1990. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60636. Order Number DE92000706. Source: OSTI; NTIS; INIS; GPO Dep.

All projects are working toward a goal for describing the three dimensional nuclear topography in terms of relative spatial relationships among genes (specific DNA sequence). Methods are now being perfected to detect these genes, quantitatively and spatially, to perturb these genes specifically, and to measure the perturbation in order to assure specificity. We are developing methods to assay, after perturbation of the target DNA within living cells, whether or not only the target sequence are attacked while other sequences remain unharmed. We are now at the stage to do chemical gene modification or masking within living cells in a strictly sequence-specific manner. Soon, we will be able to study the function and the physical location of each gene in living cells with exquisite specificity. 25 refs., 15 figs.

35094 (DOE/ER/60676–T1) **[Molecular approaches to the study of the radiation-sensitive disease ataxia-telangiectasia (AT)]: Final technical report.** Stanford Univ., CA (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract FG03-88ER60676. Order Number DE92000759. Source: OSTI; NTIS; INIS; GPO Dep.

The specific aims of this proposal were to isolate the wild-type AT-D gene by functional cloning, characterize this gene in detail, and overexpress the cloned gene and explore the structure and function of its protein product. The sequence of the gene will be compared to that of alleles from complementation groups A, C, D and E in order to determine the molecular basis for mutational inactivation of the AT gene and determine definitively whether more than one wild-type gene exists in the human genome. We have isolated a cell line consisting of a single human chromosome 18 on a mouse background. It originally appeared that the AT-D gene was localized to this chromosome, but additional studies revealed the presence of cytologically undetectable human chromosome 11. Further study now indicated that the human AT-D gene is located on human chromosome 11 in the region 11q22-23. 4 refs. (MHB)

**35095** (DOE/ER/61139–1) **Chromosome region-specific libraries for human genome analysis: Progress report, March 1, 1991–August 31, 1991.** Kao, Fa-Ten. Eleanor Roosevelt Inst. for Cancer Research, Denver, CO (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61139. Order Number DE92001741. Source: OSTI; NTIS; GPO Dep.

We have made important progress since the beginning of the current grant year. We have further developed the microdissection and PCR- assisted microcloning techniques using the linker-adaptor method. We have critically evaluated the microdissection libraries constructed by this microtechnology and proved that they are of high quality. We further demonstrated that these microdissection clones are useful in identifying corresponding YAC clones for a thousand-fold expansion of the genomic coverage and for contig construction. We are also improving the technique of cloning the dissected fragments in test tube by the TDT method. We are applying both of these PCR cloning technique to human chromosomes 2 and 5 to construct region-specific libraries for physical mapping purposes of LLNL and LANL. Finally, we are exploring efficient procedures to use unique sequence microclones to isolate cDNA clones from defined chromosomal regions as valuable resources for identifying expressed gene sequences in the human genome. We believe that we are making important progress under the auspices of this DOE human genome program grant and we will continue to make significant contributions in the coming year. 4 refs., 4 figs.

**35096** (LA-UR–91-3050) **Biosynthesis of metal-binding polypeptides and their precursors in response to cadmium in Datura innoxia.** Jackson, P.J.; Delhaize, E.; Kuske, C.R. Los Alamos National Lab., NM (United States). [1991]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Grant RPI5004666/F482. (CONF-9109284–1: 4. international symposium on genetic aspects of plant mineral nutrition, Canberra (Australia), 30 Sep - 4 oct 1991). Order Number DE92000194. Source: OSTI; NTIS; GPO Dep.

Metal-tolerant Datura innoxia cells synthesize large amounts of a class of metal-binding polypeptides, poly($\gamma$-glutamylcysteinyl) glycines [$(\gamma\text{-EC})_n$G, n=2-5], when exposed to Cd. These polypeptides have a high affinity for Cd (2) and certain other metal ions and are thought to play a role in metal tolerance in higher plants. $(\gamma\text{-EC})_n$G is biosynthetically derived from glutathione. Therefore, the response of Datura cells to Cd must include an increase in production of glutathione and its precursors, since cells rapidly accumulate very high concentrations of these metal-binding polypeptides. The biosynthesis of $(\gamma\text{-EC})_n$Gs, glutathione, and cysteine in response to Cd exposure is described. The physiological significance of the synthesis of these polypeptides and their precursors and its relevance to Cd tolerance and metal homeostasis are discussed. 34 refs., 6 figs., 1 tab.

**35097** (ORNL/TM–11924) **GAP: A computer program for gene assembly.** Eisnstein, J.R.; Uberbacher, E.C.; Guan, X.; Mural, R.J.; Mann, R.C. Oak Ridge National Lab., TN (United States). Sep 1991. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000282. Source: OSTI; NTIS; GPO Dep.

A computer program, GAP (Gene Assembly Program), has been written to assemble and score hypothetical genes, given a DNA sequence containing the gene, and the outputs of several other programs which analyze the sequence. These programs include the codign-recognition and splice-junction-recognition modules developed in this laboratory. GAP is a prototype of a planned system in which it will be integrated with an expert system and rule base. Initial tests of GAP have been carried out with four sequences, the exons of which have been determined by biochemcial methods. The highest-scoring hypothetical genes for each of the four sequences had percent correct splice junctions ranging from 50 to 100% (average 81%) and percent correct bases ranging from 92 to 100% (average 96%). 9 refs., 1 tab.

**35098** (EGG–10617-2094) **Conservation of the endangered San Joaquin kit fox at Camp Roberts Army National Guard Training Site, California.** EG and G Energy Measurements, Inc., Las Vegas, NV (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9108166–1: National Military Fish and Wildlife Association (NMFWA) meeting, Colorado Springs, CO (United States), 16 Aug 1991). Order Number DE91018987. Source: OSTI; NTIS; GPO Dep.

Camp Roberts is a California Army National Guard Training Site located in central California. The San Joaquin kit fox, an endangered subspecies of kit fox, has been known to occur at Camp Roberts since 1960. The population of foxes began to increase in the early 1970's when use of rodenticides decreased. In 1987 the California Army National Guard contracted EG&G Energy Measurements to conduct a 3-year study to assess the effects of Camp Roberts activities on the kit fox population. A discussion of the current Conservation Program is provided. EG&G will prepare a revised Biological Assessment in late 1991. It appears that activities which occur on Camp Roberts, if efficiently regulated, will not have any significant effect on the local population of kit foxes. (MHB)

**35099** (DOE/ER/60519–T3) **[New imaging systems in nuclear medicine]: Technical progress report.** Massachusetts General Hospital, Boston, MA (United States). Physics Research Lab. [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60519. Order Number DE92000786. Source: OSTI; NTIS; INIS; GPO Dep.

We continue to use and maintain PCR-I, the single-slice high-resolution high-sensitivity positron emission tomograph, while development proceeds on PCR-II, a three-dimensional PET system. A two-dimensional BGO scintillation detector has been designed and we are nearing completion of the detector, including the light guide, crystals and phototube assembly, and the gantry electronics. We are currently exploring techniques for a very high resolution (sub-mm) PET imaging system. We are using the current PCR-I system to assess changes in presynaptic dopamine receptors and glucose utilization in current biological models of Huntington's disease. Our preliminary studies support the use of the primate (Cynomolgus monkey) model of Huntington's disease to monitor in vivo functional changes. We are planning to extend this study to examine the MPTP model of Parkinson disease, and to assess the therapeutic value of $D_1$ dopamine receptor agonists for treatment of MPTP-induced neurological defects. 13 refs., 5 figs. (MHB)

**35100** (DOE/ER/60874–2) **Design of an accelerator-based epithermal neutron beam for boron neutron capture therapy.** Yanch, J.C. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Zhou, X.L.; Brownell, G.L.; Shefer, R.E.; Klinkowstein, R.E. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1990]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER60874. (CONF-901226–7: 4. international symposium on neutron capture therapy, Sydney (Australia), 3-7 Dec 1990). Order Number DE91018873. Source: OSTI; NTIS; INIS; GPO Dep.

Recent interest in the production of epithermal neutrons for use in boron neutron capture therapy (BNCT) has prompted an investigation into the feasibility of generating such neutrons with a tandem cascade accelerator. Accelerator-produced neutrons in the range of roughly 200–800 keV are generated in a lithium compound target via the $^{7}Li(p,n)^{7}Be$ nuclear reaction in a tandem cascade accelerator currently under development by Science Research Laboratory, Somerville, MA. Details of the design of the proton accelerator and operating characteristics will be too energetic for use in neutron capture therapy, a detailed dosimetric study was undertaken to determine the energy, or range of energies most suitable for NCT. This study was carried out using three-dimensional Monte Carlo transport calculations; results are discussed briefly here. Once the most suitable range of energies for BNCT was determined, it was then possible to design an appropriate moderator assembly to shift the energy of the neutrons down to the therapeutically useful levels. Such an assembly has been designed with the aid of computer simulation; calculations of treatment parameters indicate that the accelerator neutron beam can provide dose rates and advantage depths comparable to currently available reactor beams for neutron capture therapy. 10 refs., 5 figs.

A two-day workshop on the accelerator for particle therapy was held on August 22-23, 1990, with the aim of mutual understanding of medical accelerators among investigators. The state-of-the-art facilities in Japan and medical proton accelerators in Japan and other countries were introduced. This is a compilation of papers presented at the workshop: (1) particle radiotherapy at the National Institute of Radiological Sciences (NIRS); (2) proton therapy; (3) treatment planning, especially for photon and electron therapies; (4) heavy ion synchrotron project at the NIRS; (5) medical proton accelerator project of Tsukuba University and recent status of Loma Linda University Medical Center Proton Beam Facility; (6) inspection report on the Loma Linda University Medical Center Proton Beam Facility; (7) accelerator project of Kyoto University; (8) actual conditions of the 7 MeV proton linear accelerator; (9) design study of superconducting compact cyclotron prototype model; (10) medical superconducting prototype cyclotron; (11) RCNP cyclotron cascade project; (12) beam extraction from synchrotron; (13) radiation safety design in high energy particle accelerator facilities. (N.K.).

Source: OSTI; NTIS; GPO Dep.

Biological hard tissues are load-bearing structural materials, composed of a mineral (ceramic) component and an organic (protein) component. The microstructures of three composite designs commonly found in mollusk shells, the nacreous, foliated, and crossed-lamellar structures are discussed. Although all of these can be viewed as laminar composites, differences exist in the morphology, crystal structure, defect microstructure, and spatial organization of the mineral, $CaCo_3$. Electron microscopy investigations of these materials reveal a variety of crystallographic defects, the details of which have been used to refine existing models for biomineralization in these tissues. Flexural strengths in four-point

bending are on the order of 100 Mpa. Examples of "graceful failure", i.e. stable crack growth in bulk samples, in the crossed-lamellar and foliated structures are reported. Fractography of such specimens reveals that a number of familiar toughening mechanisms operate together to produce this desirable structural flaw tolerance. Even more unusual is the fact that mollusk shells are harder than the native minerals from which they are made! The damage zones and the anisotropy of hardness suggest an explanation for the anomalous hardness based on microstructural design rather than on intrinsic hardening of the mineral phase. 27 refs., 15 figs., 2 tabs.

Salmonella contamination of chicken is a major public health concern. While heat pasteurization and chlorine treatment for Salmonella have shortcomings, low doses of gamma radiation are very effective in controlling Salmonella. The organoleptic shelf life of fresh chicken at 1 to 4 degrees Celsius (6 to 10 days) is extended by a factor of $\sim 2$ by a dose of 2.5 kGy and does not increase further with higher doses up to $\sim 8$ kGy. The reason for the lack of greater organoleptic shelf life is the continuing degradative changes in meat due to enzymatic activity. The product obtained with doses around 2.5 kGy is very good, and is acceptable up to doses of $\sim 8$ kGy. Irradiation at doses higher than 2.5 kGy results in some odor that disappears on storage at 1 to 4 degrees Celsius, and on roasting of the meat. The odor is due to the production of some of the small molecular weight volatile compounds, which are also produced by free-radical mediated autoxidation, thermal treatment, and enzymatic and microbial reactions with the meat components. Low-dose irradiation shows insignificant changes in the physical attributes like water-holding capacity, changes in proteins, amino acids, fats and rancidity indices. Review of the feeding studies with radiation-sterilized chicken meat ($\geq$ 30 kGy, the Raltech study) indicated that the irradiated meat was wholesome and safe. It is therefore, reasonable to assume that the low-dose ($\leq$ 8 kGy) irradiated chicken would also be safe. Also the two Federation of American Societies for Experimental Biology (FASEB) committees, which reviewed the over 100 identified volatile compounds produced in $\mu$g/kg (ppb) quantities, concluded that there were no ground for suspecting these products of being a hazard to the consumer.

**35108** (NIRS-RSD–93) **Radioactivity survey data in Japan, part 2. Dietary materials.** National Inst. of Radiological Sciences, Chiba (Japan). Apr 1991. 32p. Order Number DE92704015. Source: OSTI; NTIS (US Sales Only); INIS.

The publication is aimed at providing radioactivity survey data in environmental and dietary materials in Japan. Part 2 gives dietary materials, consisting of total diet, milk, vegetables, sea fish, freshwater fish, shellfish, and seaweeds. Samples were collected from 42 sampling locations during the period between May 1989 and June 1990, and were sent to the Japan Chemical Analysis Center for radiochemical analysis. Strontium-90 and cesium-137 in these dietary materials are tabulated. The maximum concentrations of strontium-90 and cesium-137 were as follows: 0.16+-0.017 Bq/pcenter dotd and 0.20+-0.014 Bq/pcenter dotd, respectively, for total diet; 0.10+-0.011 Bq/l and 1.0+-0.03 Bq/l for milk (producing districts); 0.08+-0.010 Bq/l and 0.14+-0.010 Bq/l for milk (consuming districts); 0.55+-0.026 Bq/Kgwet and 1.2+-0.03 Bq/Kgwet for vegetables (producing districts); 0.34+-0.023 Bq/Kgwet and 0.05+-0.009 Bq/Kgwet for vegetables (consuming districts); 0.02+-0.011 Bq/Kgwet and 0.25+-0.026 Bq/Kgwet for sea fish; 5.5+-0.09 Bq/Kgwet and 0.082+-0.033 Bq/Kgwet for freshwater fish; 0.01+-0.010 Bq/Kgwet and 0.06+-0.009 Bq/Kgwet for shellfish; and 0.03 +-0.009 Bq/Kgwet and 0.03+-0.006 Bq/Kgwet for seaweeds. Yearly changes in the concentrations of both strontium-90 and cesium-137 from 1986 through 1990 are given in figures. (J.P.N.).

**35109** (ANL/CP–74386) **History of the determination of radium in man since 1915.** Rundo, J. Argonne National Lab., IL (United States). [1991]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-911011–1: International workshop on radium, uranium, thorium and related nuclides in industry and medicine: history and current use, Badgastein (Austria), 1-3 Oct 1991). Order Number DE92000355. Source: OSTI; NTIS; GPO Dep.

The determination of radium in man can be traced back to experiments in 1915 when volunteers were injected with, or ingested, solutions of a radium salt, and the excreta were analyzed for radium. However, the first direct demonstrations of the presence of radium in vivo years after exposure were reported in 1925 by Martland et al. A few years later, Schlundt et al. repeated Martland's types of measurements with a Wulf-Hess electroscope, in an attempt to be quantitative. Data on the excretion rate of radium were published by Schlundt and Failla in 1931. The results of an investigation by the US Public Health Service of the health aspects of radium dial painting were published in three papers in 1933. In the second of these, Ives et al. reported results for 40 subjects who showed gamma-ray results of 1 $\mu$g radium (i.e., retained radon) or more. There was a major improvement in sensitivity in 1937 when Evans described the use of a Geiger-Mueller detector and the metre-arc geometry. Ten years later, Hess and McNiff published details of an ionization chamber method that did permit such levels to be determined. In the early 1950s, three groups described the first equipments for the assay of radioactivity in the human body that could detect the radiation from the naturally radioactive potassium content. In 1955, the introduction by Marinelli et al. of the sodium iodide crystal as gamma-ray detector revolutionized the assay of radium (and all other gamma-ray emitters) in vivo. These factors have all contributed to a steady decrease in the lower limit of detection of radium in man that was roughly exponential from 1929 to the mid-1950s with a half-period of a little over 3 years. 36 refs., 4 figs., 5 tabs.

**35110** (BfS-ISH–149/90) **Blood amylase - a biochemical radiation indicator?.** Hofmann, R.; Hendriks, W.; Schreiber, G.A.; Boegl, K.W. Bundesamt fuer Strahlenschutz, Neuherberg (Germany). Inst. fuer Strahlenhygiene. Dec 1990. 48p. Order Number DE92714366. Source: OSTI; NTIS (US Sales Only); INIS.

This study describes the suitability of the biological radiation indicator 'amylase in human blood serum' to identify, if previous irradiation has occurred. After 'in vivo' exposure, of the human body with organ doses > 0,5 Gy, high activities of the enzyme are found in serum. The important results of examinations from different work groups and from own experiments were summarized in tabular form and evaluated from the statistic point of view. The results show that in more than 90% of all cases, the amylase system is suitable to identify exposure beyond 0,5 to 1 Gy, approximately. However, this is only possible if the salivary glands were also

exposed and blood samples are taken about 18 hours after exposure. For the differentiation between induced increase of amylase from disease and radiation induced increase, it is recommended to carry out the isoamylase test, which makes it possible to distinguish between the individual enzymes. The assessment of the total amylase is appropriate to detect, with a range of significance of P = 0,05 that radiation exposure has occurred. The increase of activity is dose dependent when the salivary glands lie in the radiation field, however, the variations of activity are very high. Therefore the radiation dose cannot be considered. Only in cases where a very high radiation induced increase of activity is observed, a rough estimation of dose at the parotid glands can be made. (orig./MG).

Source: OSTI; NTIS; INIS; GPO Dep.

Although an enormous amount of progress has been made in the fields of radiation protection and risk assessment, a number of significant problems remain. The one problem which transcends all the rest, and which has been subject to considerable misunderstanding, involves what has come to be known as the 'linear non-threshold hypothesis', or 'linear hypothesis'. Particularly troublesome has been the interpretation that any amount of radiation can cause an increase in the excess incidence of cancer. The linear hypothesis has dominated radiation protection philosophy for more than three decades, with enormous financial, societal and political impacts and has engendered an almost morbid fear of low-level exposure to ionizing radiation in large segments of the population. This document presents a different interpretation of the linear hypothesis. The basis for this view lies in the evolution of dose-response functions, particularly with respect to their use initially in the context of early acute effects, and then for the late effects, carcinogenesis and mutagenesis. 11 refs., 4 figs. (MHB)

**35112** (CONF-910137–, pp. 182-195) **Minimizing exposure in nuclear medicine through optimum use of shielding devices.** Rutherford, B.L. (Pennsylvania State Univ., Hershey, PA (USA)); King, S.H.; Erdman, M.C.; Miller, K.L. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

Exposure to radiation from nuclear medicine nuclides can be minimized through the use of various shielding devices. This paper reviews the dose reductions achieved through use of various syringe shields, lead aprons, leaded gloves, and several types of eyeglass lenses for $^{67}Ga$, $^{99m}Tc$, $^{131}I$ and $^{201}Tl$. The authors have found that combination of devices can best provide for minimizing doses.

**35113** (CONF-910137–, pp. 213) **Radiation biology of the embryo/fetus.** Roessler, G.S. (Univ. of Florida, Gainesville (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The effects of ionizing radiation exposures on the embryo and fetus must be reviewed and updated periodically so that the exposures of the pregnant or potentially pregnant female can be evaluated. Experimental data on the effect of radiation on the developing embryo and fetus show that the unborn child is more radiosensitive than an adult. Until recently most of this data came from studies obtained with the mouse or rat. These animals were chosen for study because they reproduce in quantity with a relatively short gestation period. Animal irradiation in utero produced lethal effects even at relatively small doses before or immediately after implantation of the embryo into the uterine wall. Malformations were seen following exposures during organogenesis and growth disturbances without malformations were observed after exposures which took place during the latter part of pregnancy. New data from studies of persons exposed in utero during the atomic bombings of Hiroshima and Nagasaki show an increased incidence of microcephaly and mental retardation. The critical period for exposure was from 8 to 15 weeks of intrauteine life. During this time period a linear relationship was found between the incidence of mental retardation and absorbed dose. This human data can be used to develop risk coefficients for exposures during various stages of development. Some studies show an increased incidence of childhood leukemia and other malignancies in children who were x-rayed in utero. This increased sensitivity of the embryo and fetus to radiation carcinogenesis has generally not been shown in animal studies nor in the studies of the survivors of the bombings at Hiroshima and Nagasaki.

**35114** (CONF-910137–, pp. 232-241) **Dealing of embryo/fetal exposures in a medical setting.** Miller, K.L. (Pennsylvania State Univ., Hershey (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The medical environment presents two uniquely different situations involving potential radiation exposure to the embryo or fetus. On the one hand we have the potential for radiation exposure to the embryo of fetus of the occupationally exposed employee where the recommendations are well defined. On the other hand we have the pregnant or potentially pregnant patient requiring diagnostic radiological examinations or therapeutic procedures where the recommendations are not as well defined. This paper provides an overview of both situations, a discussion of potential exposures and a review of methods for estimating fetal doses when the exposed individual is the patient.

**35115** (INIS-mf–14008, pp. 15-18) **Hematopoietic stem cells - sensitive target cells for environmental carcinogens.** Peterson, H.P. In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

Stem cells of the hemopoietic system in the bone marrow are important target cells for carcinogenic effects of the environment, because it is their huge proliferation ability that enables the potential spreading of transformed (blood) cells all over the body: Normally about 250 billions of red cells and about 125 billions of white cells have to be produced daily by an adult human; in case of blood loss or infection this cell production can be increased enormously. Hemopoietic Stem Cells (HSC) react in a very sensitive manner to environmental stimuli as can be shown on examples with radiation, chemical agents or magnetic field exposure. The effect of these environmental factors was seen as a change in the number of colonies on spleens of conditioned mice after bone marrow transplantation. In order to look for a change in the quality of HSC we have developped an assay, by which early and late effects of potential carcinogenic factors in the hemopoietic system can be demonstrated. It is to be discussed, whether these late effects are involved with a special mechanism for the induction of cancer, expecially leukemia. (orig.).

In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

Only a complete description of biological systems allows the assessment of health risks due to ionizing radiations at environmental levels (Feinendegen, 1990). The smallest functional entity in biological systems appears to be the living cell. At first the risk of a cell to a radiation stimulus and the severity of this stimulus has to be ascertained. These are physical parameters, which depend on the type of radiation and the dose. Furtheron, the kind and probability of the cell reaction to radiation stimuli has to be determined. This is a biological parameter, which depends on the condition of the cell at the time of exposure. This parameter is not invariant, since defence and repair mechanisms are available to the cell. Only if the response of cells is known as a function of radiation quality and its condition at the time of the exposure, the assessment of concequences for a cell system (organ or organism) may be attempted. Due to the variability of cell responses to ionising radiation events, a linear relation between dose and effect may not be generally valid at the system level. (orig.).

**35118** (INIS-mf–14008, pp. 56-59) **Environmental radioactivity and cancer: Radon as an example.** Paretzke, H.G. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany, F.R.)); Jacobi, W. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

The natural radiation exposure of man by radon and its daughter products represents the largest contribution to the average annual radiation exposure of the public (nearly one to a few Millisievert a year). The critical bronchial region of the lung, therefore, experiences an average natural exposure ten times higher than other tissues and organs outside the lung. The resulting mean lifetime exposure of the public is lower only by a factor of 4 than the value where among miners a statistically significant increase of the lung cancer rate was found. Under the present assumptions on the dose-effect relationships for radon and its decay products, up to 10 percent of the annually nearly 25,000 lethal lung cancer cases in the Federal Republic of Germany might be due to the inhalation of these radionuclides. A number of simple protection measures exist to reduce this radiation risk which is for the world population each single year larger by about two orders of magnitude than the 50 year cumulated radiation risk from the reactor accident in Chernobyl. (orig.).

**35119** (INIS-mf–14008, pp. 60-63) **Experiments on carcinogenesis of thorotrast and quartz.** Wesch, H. (Deutsches Krebsforschungszentrum, Heidelberg (Germany, F.R.)); Spiethoff, A.; Wegener, K.; Klimisch, H.J. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

A long-term animal study was designed to investigate the effect of Thorotrast on the lung in combination with an additional, chronical insult. For that reason rats were treated with Thorotrast and exposed to different concentrations of crystalline silica (quartz). The results demonstrate that the combined action of Thorotrast and quartz results in an increase of the lung tumor development. The carcinogenic effect of each agent and their synergistic interaction are discussed. (orig./MG).

This issue is the collection of the papers presented at the title meeting on brain damage and heritable damage. The 12 of the presented papers are indexed individually. (J.P.N.).

**35121** (NIRS-M–78, pp. 83-90) **Radioactive aerosol exposure system of NIRS.** Yamada, Yuji (National Inst. of Radiological Sciences, Chiba (Japan)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (In Japanese). (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

Radioactive aerosol exposure system for small rodents was developed, and its basic characteristics were investigated from the viewpoint of aerosol engineering on inhalation toxicology. The system has three nebulizers which liquid is feeded with syringe pump. Aerosol concentration within the exposure chamber is controlled by changing the speed of liquid feeding, and it is automatically maintained by switching one of nebulizers on the base of aerosol monitoring data from a high sensitivity photometer. Correspondingly, the air pressure and the air flow rate are controlled for keeping constant exposure. For acute exposure, animals are hold in specially designed containers, and only their noses are exposed. During exposure, the container also works as whole-body plethysmograph box and is enable us to measure animal's respiratory function. (author).

**35122** (NIRS-M–78, pp. 115-123) **Factors affecting on the particle deposition in the respiratory tract.** Kubota, Yoshihisa (National Inst. of Radiological Sciences, Chiba (Japan)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (In Japanese). (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

The deposition pattern of inhaled particles in the respiratory tracts is affected by anatomical structure of the respiratory tracts and respiratory pattern of animals, which are modified by many factors as animal species, physiological and psychological conditions, age, sex, smoking drug, lung diseases, etc. In human, studies have been focused on the initial lung deposition of particles and have made it clear that the respiratory pattern, gender, and diseases may have influence on the deposition pattern. On the other hand, there was little knowledge on the initial lung deposition of particles in laboratory animals. Recently, Raabe et al. have reported the initial lung deposition of $^{169}$Yb-aluminosilicate particles in mice, rats, hamsters, guinea pigs and rabbits. The authors have also investigated the lung deposition of latex particles with different sizes and $^{198}$Au-colloid in rats whose respiratory volumes during the inhalation were monitored by body plethysmography. These experiments indicated that the deposition of inhaled particles in distal lung e.g. small bronchiolar and alveolar region, was much lower in laboratory animals than that of human. This species difference may be due to smaller diameter of respiratory tract and/or shallower breathing and higher respiratory rate of laboratory animals. The experimental animals in which respiratory diseases were induced artificially have been used to investigate the modification factors on the deposition pattern of inhaled particles. As respiratory diseases, emphysema was induced in rats, hamsters, beagle dogs in some laboratories and pulmonary delayed type hypersensitivity reaction in rats was in

our laboratory. The initial lung deposition of particles in these animals was consistently decreased in comparison with normals, regardless of the animal species and the type of disease. (author).

**35123** (NIRS-M–78, pp. 133-141) **Partial deposition distribution of unattached atom to tracheobronchial region.** Shimo, Michikuni (Nagoya Univ. (Japan)); Ohashi, Atsuto. National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (In Japanese). (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

To evaluate precisely the human lung dose, it is important to know the deposition fraction and positions on the surface of trachea and bronchial for unattached atoms. In this paper, historical review on deposition experiments and calculation were summarized. In addition the author's result was introduced for deposition experiment on unattached radon daughter atoms to tracheobronchial using a tree model based on Weibel's lung model. The results were as follows; (1) 'hot spots' which were deposited several times than around area were especially observed in inner side of generation. (2) Deposition fraction at generation 0 was 2.2≈2.7 times value calculated from the Gormley and Kennedy formula whereas values at other generations agreed with calculated ones. (author).

**35124** (NIRS-M–78, pp. 142-149) **The range distribution of α-particles in deep lung.** Nakano, Takashi (National Inst. of Radiological Sciences, Chiba (Japan)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (In Japanese). (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

We calculated the range distribution of α-particles in deep lung by using digitalized graphic data made from a real tissue section. We also used a mathematically made honeycomb lattice model to compare the results between these two different models. The initial α-particle energy was chosen in the range given by the long lived α-emitters that might be potentially inhaled by human. Energy loss of α-particles was calculated from a semi-empirical formula proposed by Benton and Henke (Nucl. Instrum. Methods 67 (1969) 87). Self-absorption effect of source particle was also evaluated, in which a spherical source was assumed. The average ranges increased proportionately with the initial α-particle energy for both models. The distribution of the ranges for the honeycomb lattice model, however, should several distinct peaks which reflected the regular structure of the honeycomb lattice. For the real lattice, on the other hand, the ranges distributed broadly with a gentle-sloping hill. These results suggested the validity of the present range calculation using a real tissue section. The self-absorption effect on the range can be neglected for such a small source particle that could pass into deep lung and deposit there. (author).

**35125** (NIRS-M–78, pp. 150-157) **Particle size dependence of hit probability for lung cells.** Ishigure, Nobuhito (National Inst. of Radiological Sciences, Chiba (Japan)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (In Japanese). (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

The macroscopic quantity 'absorbed dose' loses its validity to interpret the radiation-induced biological effects in the lung inhaled with particulate α-emitters like transuranic elements, because the doses to individual cells differ more widely than the range of doses over which the dose-response relationship can be regarded as linear. We intend to make up a three-dimensional model of parenchymal lung using a stack of actual histological sections in order to computer microscopic dose distribution around particulate α-emitters. This theoretical dosimetric approach will provide a scientific basis to the extrapolation of results of animal experiments utilizing high doses to man exposed to low level radioactivity and also to the understanding of biological effects associated with high LET radiations. Lung cells which survive α-particle hits were calculated, which will be a significant index of potential risk. Three models were assumed for the structure of parenchymal lung, which were (1) structureless lung of uniform density, (2) lattice of honeycomb pattern and (3) digital image of actual histological section of rat lung. The result shows that the survival cells decrease exponentially with the diameter of inhaled particles in any models. But the slope of the curve for the structureless lung is much greater than those for any other two models. This result suggests the validity of the dosimetric approach using actual histological section to estimate the inhalation risk of particulate α-emitters. (author).

**35126** (NIRS-M–78, pp. 199-212) **Life-span studies of inhaled plutonium in beagle dogs.** Bair, W.J. (Pacific Northwest Lab., Richland, WA (USA)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

In 1970 a life-span study with over 300 beagle dogs was begun. Groups of beagle dogs were given single exposures to $^{239}PuO_2$, $^{238}PuO_2$, or $^{239}Pu(NO_3)_4$ to obtain graded levels of initial lung burdens ranging from 1 to 1800 Bq lung. After 16 years, the lungs contained about 2% of the initial lung burden of $^{239}PuO_2$, the thoracic lymph nodes 20%, skeleton 1% and liver 10%. After 15 years the lungs contained about 0.2% of the initial lung burden of $^{238}PuO_2$, thoracic lymph nodes 5%, skeleton 10%, and liver 10%. After 10 years the lungs contained about 0.29% of the initial lung burden of $^{239}Pu(NO_3)_4$, thoracic lymph nodes 0.17%, skeleton 18% and liver 13%. Chronic lymphopenia has been one of the earliest biological effects observed. Other effects associated with plutonium exposure included sclerosis of the tracheobronchial lymph nodes, focal radiation pneumonitis, adenomatous hyperplasia of the liver and dystrophic osteolytic lesions in the skeleton. In 16 years, mortality due to radiation pneumonitis and/or lung tumor increased with deposition of 24 Bq of $^{239}PuO_2$. In 15 years, mortality due to lung and/or bone tumors increased with deposition of 96 Bq of $^{238}PuO_2$. In 11 years, after exposure, mortality due to lung and/or bone tumors increased with deposition of 18 Bq of $^{239}Pu(NO_3)_4$. Lung cancers appeared to originate in the parenchymal regions of the lungs and were of several types; bronchiolar alveolar carcinoma, papillary adenocarcinomas, adenosquamous carcinoma, and epidermoid carcinoma. Metastases were primarily to the thoracic lymph nodes. Sites of osteosarcomas in the $^{238}PuO_2$ and $^{239}Pu(NO_3)_4$ dogs were in the lumbar cervical and thoracic vertebrae, humerus, pelvis, facial bones, ribs and nasal turbinates.

**35127** (UCRL-CR–104682-Rev.1) **Technical basis document for internal dosimetry: Revision 1.** Hickman, D.P. (Chem-Nuclear Geotech, Inc., Grand Junction, CO (United States)). Lawrence Livermore National Lab., CA (United States); Chem-Nuclear Geotech, Inc., Grand Junction, CO (United States). Sep 1991. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (DOE/ID/12584–77). Order Number DE91018834. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the technical basis for the Chem-Nuclear Geotech (Geotech) internal dosimetry program. Geotech policy describes the intentions of the company in complying with radiation protection standards and the "as low as reasonably achievable" (ALARA) program. It uses this policy and applicable protection standards to derive acceptable methods and levels of bioassay to assure compliance. The models and computational methods used are described in detail within this document. From these models, dose- conversion factors and derived limits are computed. These computations are then verified using existing documentation and verification information or by demonstration of the calculations used to obtain the dose-conversion factors and derived limits. Recommendations for methods of optimizing the internal dosimetry program to provide effective monitoring and dose assessment for workers are provided in the last section of this document. This document is intended to be used in establishing an accredited dosimetry program in accordance with expected Department of Energy Laboratory Accreditation Program (DOELAP) requirements for

the selected radionuclides provided in this document, including uranium mill tailing mixtures. Additions and modifications to this document and procedures derived from this document are expected in the future according to changes in standards and changes in programmatic mission. 20 refs., 22 figs., 60 tabs.

## 5603 Chemicals Metabolism and Toxicology

**35128** (ANL/CP–72578) **Cadmium-induced bone loss: increased susceptibility in female beagles after ovariectomy.** Bhattacharyya, M.H.; Sacco-Gibson, N.A.; Peterson, D.P. Argonne National Lab., IL (United States). [1991]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9109265–1: Toxicity and carcinogenicity of cadmium in the human environment international symposium, Gargnano (Italy). 25-27 Sep 1991). Order Number DE91018623. Source: OSTI; NTIS; GPO Dep.

Bone resorption, as measured by release of bone $^{45}Ca$, was significantly increased in elderly female beagles within 96 h of exposure to 15 mg/L Cd in drinking water. The $^{45}Ca$ response was greater in ovariecotomized (OV) animals than in sham-operated (SO) controls and was not mediated by changes in calciotropic hormone concentrations. Mean blood Cd concentrations were 3–8 $\mu$g/L during the earliest bone resorption response and 13–15 $\mu$g/L at the end of the study. During 7 mo of Cd exposure, bone mineral densities decreased most in the OV animals exposed to Cd: $-15.4 \pm 4.3\%$ for the tibia distal end and $-7.2 \pm 1.2\%$ for the lumbar vertebrae (L2-L4) (mean $\pm$ SE, n=4). Results indicate that Cd may act directly on bone and that postmenopausal women exposed to Cd in industry or via cigarette smoke may be at increased risk of Cd-induced bone loss. 21 refs., 4 figs.

**35129** (CONF-911246–1) **Benzene dosimetry in experimental animals: Relevance for risk assessment.** Henderson, R.F. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst.); Sabourin, P.J.; Medinsky, M.A.; Birnbaum, L.S.; Lucier, G.L. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. [1991]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Relevance of animal studies to evaluate human cancer risk conference; Austin, TX (United States); 5-8 Dec 1991. Order Number DE91017482. Source: OSTI; NTIS; GPO Dep.

In two-year, oral bioassay studies of the carcinogenicity of benzene conducted in F344 rats and B6C3F$_1$ mice, the mice developed a greater number and variety of tumors than did the rats. To aid in the use of these animal data to predict health risks for humans exposed to benzene, a series of studies were conducted to determine the effect of species, dose, and route and rate of exposure on the distribution and metabolic fate of benzene. The objective of the studies was to determine if the dosimetry of benzene and its metabolites could help to explain the species' differences in response to benzene. 20 refs., 5 figs., 8 tabs.

**35130** (CONF-911246–2) **The utility of animal inhalation studies to assess the risk of mineral fiber-induced pulmonary cancer.** Johnson, N.F. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. [1991]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Relevance of animal studies to evaluate human cancer risk conference; Austin, TX (United States); 5-8 Dec 1991. Order Number DE91017483. Source: OSTI; NTIS; GPO Dep.

Animal inhalation exposures to fibrous materials such as crocidolite and erionite produce lesions similar to those found in exposed humans. This indicates that the animal inhalation model is relevant for identifying hazardous fibrous materials. Intratracheal instillations and intracoelomic injections are alternative bioassays that can be used to screen for the most biologically active materials. These nonphysiological routes of administration can give false positive results; therefore, animal inhalation studies should be the ultimate bioassay used in the absence of appropriate epidemiological data. 46 refs., 3 tabs.

**35131** (ETDE-mf–2704338) **Multi-phase system for monitoring and mapping forest disease making use of all available remote sensing data sources. Final report B1.** Akca, A.; Rhein, M.; Schnurr, J. Goettingen Univ. (Germany). Inst. fuer Forsteinrichtung und Ertragskunde; Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Sep 1990 35p. (In German). Contract BMFT 0339072A. Order Number DE92704338. Source: OSTI; NTIS (US Sales Only).

On the basis of remote sensing data from the Hils forest, the practical usefulness of a method for diagnosing forest disease symptoms was tested. Testing covered CIR aerial photographs, sets of data from the airborne scanners BENDIX and DAEDALUS; LANDSAT/TM scenes, and a panchromatic SPOT scene. A low-altitude flight using the DAEDALUS sensor aimed to verify the individual relationship between the vitality of crowns of spruces and differences in their spectral signatures. For this purpose, re-identifiable trees were classified by terrestrian surveying of harm and by CIR aerial photographs and were defined as training spots for the scanner scene. Investigated were the relations between the objects and their special signatures as a function of topographic and vegetation-specific factors. The multispectral data obtained using different methodics were interpreted with the aid of 'Hils', a forest-geographic information system. It provided the possibility for stratified treatment of these data according to object and lighting categories; this again, in combination with a forest management data base for this specific area, led to enhanced classification results and better operating efficiency for forest disease research. The results and juxtapositions of different classifications of stands and categories of harm are described against the background of their mathematical evaluation methodics and methodological problems. (IH).

**35132** (ETDE-mf–2704458) **Subproject: Cancerogenicity assessment of PAH of environmental and workplace relevance after intrapulmonary administration in rats.** Wenzel-Hartung, R. Biologisches Lab. Dr. med. H. Brune, Hamburg (Germany); Bundesminjsterium fuer Forschung und Technologie, Bonn (Germany). Oct 1988 14p. (In German). Contract BMFT 01HK764. Order Number DE92704458. Source: OSTI; NTIS (US Sales Only).

For a comparative study with the cancerogenicity of BaT (benzo(a)pyrene), three-months-old female Osborne-Mendel rats received a single intrapulmonary administration of the polycyclic aromatic hydrocarbons PHE (phenanthrene), CHR (chrysene), and BNT (benzo(b)naphtho(2,1-d)thiophene) at different dosages at baseline. Whereas a squamous cell carcinoma was observed for PHE only in the highest dose group (10 mg), a dose-dependent tumour incidence was found for CHR after implantation. The test model also established a cancerogenic action for BNT, while a similar efficacy for tumour induction was for its mean (3 mg) and high (6 mg) doses. Compared with CHR and BNT, the highest cancerogenicity was found for BaP which resulted in a clear dose-effect relationship. To trigger a similar carcinoma incidence as that of BaP, both CHR and BNT would have to be implanted into the rat lungs at a quantity higher by at least a factor of 30. (orig.).

**35133** (INIS-mf–14008) **Environment and cancer.** Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

Apart from a start introduction, the study contains 15 papers on the carcinogenetic effects of environmental pollutants and environmental radioactivity, the molecular-biological fundamentals of tumor genesis and the available methods by which the carcinogenic effects of substances can be proved. 12 of the papers can be searched as separate records in the database. (MG).

**35134** (INIS-mf–14008, pp. 11-14) **The role of carcinogens in tumor promotion.** Rahmsdorf, H.J. (Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.)); Ponta, H.; Herrlich, P. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn

(Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

The role of two groups of environmental noxes in the formation of tumors in men and animals and in the tumorigenic transformation of cells in culture are currently discussed intesively: (i) DNA damaging agents, which because of their cancer inducing properties are also designated as carcinogens; and (ii) tumor promoters, which by themselves are only weakly carcinogenic but enhance strongly the action of carcinogens. Ultraviolet irradiation, Y-radiation and many chemicals are potent carcinogens; the most potent tumor promoters are found between various plant metabolites, as e.g. phorbol esters (croton oil). We are going to show that the primary action of both groups of substances on mammalian cells is quite similar: The activation of specific genes. We are going to summarize the arguments which suggest that the activation of some of these genes plays a causative role in tumorigenesis. The genetic program induced by carcinogens and by tumor promoters leads to an enhanced mutability also in those cells, which have not been exposed to these substance. (orig.).

**35135** (INIS-mf–14008, pp. 19-22) **New methods for toxicokinetic studies on chemicals carcinogens by means of analysis of DNA damage.** Pool-Zobel, B.L. (Bundesforschungsanstalt fuer Ernaehrung, Karlsruhe (Germany, F.R.)); Brendler, S.Y.; Liegibel, U.; Kuchenmeister, F.; Schmezer, P. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

For investigating the potential carcinogenic properties of chemicals or for elucidating their mechanisms of activities, it is as important to determine their DNA damaging effects as it is to determine their mutagenicity. In the following, three methods will be presented which may be utilized to detect chemically induced DNA damage. These are the classical DNA filter elution procedure (AE), the in situ nick translation (NT), and the single cell microgel-electrophoresis (MGE) assay. Latter two methods have the advantage that they will allow genotoxic effects to be determined in many organs of the experimental animals, since only minute quantities of tissue are needed. Therefore it is possible to efficiently obtain data pertaining to the toxicokinetics of the test chemical which may be used for purposes of risk assessment. (orig.).

**35136** (INIS-mf–14008, pp. 7-10) **Formation and repair of DNA damage due to alkylating agents in human cells.** Kaina, B. (Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.)). Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

Alkylating agents are versatile environmental mutagens and carcinogens. They act spontaneously or after metabolic activation with cellular nucleophilic constituents giving rise to at least twelve different DNA alkylation products. The main premutagenic and precarcinogenic alkylation product, $O^6$-alkylguanine, is removed from DNA in a single step reaction by the alkyltransferase protein. The repair of N-alkylation products is accomplished by the concerted action of serveral enzymes which excise these lesions from DNA. A defect in the repair of $O^6$-alkylguanine has been cured successfully by insertion and expression of the bacterial alkytransferase gene into Chinese hamster and human cells. (orig.).

**35137** (INIS-mf–14008, pp. 23-26) **Quantitative assessment of preneoplastic foci for evaluation of carcinogenic potential of chemicals.** Zerban, H. (Deutsches Krebsforschungszentrum, Heidelberg (Germany, F.R.)); Bannasch, P. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

Up to the present the evaluation of the carcinogenic potential of chemical compounds mainly depends on the histological demonstration of manifest malignant neoplasia induced in animals during long-term experiments. In various tissues, especially in the liver of different species, phenotypically altered preneoplastic cell populations (preneoplastic foci) can be detected by cytomorphological and cytochemical methods, which emerge long before the appearance of tumors. Using N-nitrosodiethanolamine, a chemical compound with a considerable importance as an environmental contaminant, as an example, we demonstrate that the quantitation of such preneoplastic lesions permits the assessment of the carcinogenic efficiency of this compound. Risk assessment by this methodological approach is not only possible at earlier time points but also as for such low carcinogenic doses which do not induce tumors during the expected life time of the animals. In accordance with the reports of other laboratories the results suggest that the preneoplastic focal lesions may well be used as endpoints in carcinogenicity testing. The detection and quantitation of preneoplastic foci may considerably improve the evaluation of carcinogenesis bioassays and save both animals and time. (orig.).

**35138** (INIS-mf–14008, pp. 27-33) **Population exposure to dioxins.** Greim, H. (GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany, F.R.)); Sterzl, H. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

The average exposure of the population in the Federal Republic of Germany - mainly by ingestion of food containing fat - is at present about 1.3 pg TCDD toxicity equivalents (TE) kg body weigth per day, thus leading to a body fat concentration of about 40 mg TE/kg adipose tissue. Human milk also contains these substances. As a result babies are exposed to more than the 100-fold of the tolerable daily intake of 1 pg/kg body weight. The health hazard of PCDD/F may have been overestimated because symptoms of disease were not observed until the concentration in fat reached values of several thousand nanograms/kg adipose tissue. Furthermore environmental exposure estimated in areas adjacent to emission are too low to lead to overt human disease. Nevertheless the known sources of contamination such as waste incineration, industrial combustion processes, automobil exhausts, fossil fuel combustion or processes such as production of chlorinated compounds should be reduced to the lowest possible levels. (orig./MG).

**35139** (INIS-mf–14008, pp. 34-37) **Risk assessment of environmental pollutants: The significance of the multistep theory of carcinogenesis.** Schwarz, M. (Deutsches Krebsforschungszentrum, Heidelberg (Germany, F.R.)); Buchmann, A. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

According to our present knowledge, tumor cells develop from normal cells through a sequence of several rate-limiting steps. Agents which increase the risk of cancer may thereby act on different stages during this process. While tumor-initiating chemicals may induce critical mutations in the target cells and thus increase the transition rates from normal to preneoplastic cells and from preneoplastic to tumor cells, tumor-promoting compounds are assumed to accelerate the carcinogenic process by increasing the proliferation rate of preneoplastic cells. Knowledge on differences in the mechanism of action between tumor-initiating and tumor-promoting agents is of importance for the development of models used for the assessment of possible risks associated with exposure of humans to low concentrations of these chemicals. (orig.).

**35140** (INIS-mf–14008, pp. 45-48) **Statistical analysis of the Saarland region - air pollution and lung cancer.** Grueger, J. (Dornier GmbH, Friedrichshafen (Germany, F.R.)); Schaefer, T. Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1990. 63p. (In German). (CONF-9012111–: 12. lecture meeting of Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF): Environment and cancer, Bonn (Germany), 13-14 Dec 1990). In *Environment and cancer.* Order Number DE92704409. Source: OSTI; NTIS (US Sales Only); INIS.

An ecological analysis of associations between pollution of ambient air at place of residence and lung cancer on the basis of the Cancer Atlas of Saarland is presented. In the analysis three main risk factors of lung cancer on ecological level can be identified: Smoking habits, sociodemographic class, ambient air pollution. Results can be reproduced coherently for different sub-locations, in different sub-populations and time-periods and for both sexes. Thus the association must be regarded as statistically significantly validated at the ecological level. The effect of a simultaneously considered indicator for professional exposition was not statistically significant in the multifactorial approach due to strong suppression by the other predictors. **35141** (LA–12184-MS) **Biological effects of minerals.** Guthrie, G.D. Jr. Los Alamos National Lab., NM (United States). Sep 1991. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE91018183. Source: OSTI; NTIS; GPO Dep.

In general, clay materials exhibit a range of biological activities, from apparently inactive or slightly active, such as hematite, to highly fibrogenic and carcinogenic, such as fibrous brucite (nemalite). The zeolites also exhibit such as range, with some mordenite being slightly active and erionite being highly active; however, erionite is the only zeolite that has been studied extensively. The diversity of mineral species holds great potential for probing these mechanisms, especially when mineralogical data are integrated with biological data. Unfortunately, many of the studies reporting data on the biological effects of clays and zeolites fail to report detailed mineralogical information; hence, it is difficult at present to interpret the biological activities of minerals in terms of their physical and chemical properties. Important mineralogical data that are only rarely considered in biological research include exact mineralogy of the specimen (i.e., identification and abundance of contaminants), physical and chemical properties of minerals, and surface properties of minerals. 141 refs., 1 fig., 8 tabs.

**35142** (LBL–31097) **Electromagnetic field effects on cells of the immune system: The role of calcium signalling.** Walleczek, J. Lawrence Berkeley Lab., CA (United States). Jul 1991. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9104107–1: 75. annual meeting of the Federation of American Societies for Experimental Biology (FASEB), Atlanta, GA (United States), 21-25 Apr 1991). Order Number DE92000852. Source: OSTI; NTIS; GPO Dep.

During the past decade considerable evidence has accumulated demonstrating the exposures of cells of the immune system to relatively weak extremely-low-frequency (ELF) electromagnetic fields (< 300 Hz) can elicit cellular changes which might be relevant to in-vivo immune activity. However, knowledge about the underlying biological mechanisms by which weak fields induce cellular changes is still very limited. It is generally believed that the cell membrane and $Ca^{2+}$ regulated activity is involved in bioactive ELF field-coupling to living systems. This article begins with a short review of the current state of knowledge concerning the effects of nonthermal levels of ELF electromagnetic fields on the biochemistry and activity of immune cells, and then closely examines new results which suggest a role for $Ca^{2+}$ in the induction of these cellular field effects. Based on these findings it is proposed that membrane-mediated $Ca^{2+}$ signalling processes are involved in the mediation of field effects on the immune system. 64 refs., 2 tabs.

**35143** (CONF-9110122–7) **Development of site-specific synthetic accelerations for safety assessment of DOE facilities at Oak Ridge, Tennessee.** Aramayo, G.A.; Carley, T.G.; Jones, W.D. Oak Ridge National Lab., TN (United States). [1991]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Natural phenomena hazards mitigation conference; St. Louis, MO (United States); 15-18 Oct 1991. Order Number DE92000068. Source: OSTI; NTIS; GPO Dep.

Seismic analysis of US Department of Energy (DOE) facilities at Oak Ridge, TN, requires seismic accelerograms that have response spectra that are compatible with the site-specific design response spectra. The development of these accelerograms is accomplished by the application of the Fourier transform to compute the response spectrum of a beginning accelerogram and map it into the frequency domain. The Fourier spectrum is modified according to the difference between the computed spectra and the target spectra. The response spectrum is recomputed and compared again to the target. The modification is repeated until acceptable agreement is achieved. The modified Fourier spectrum is transformed to the time domain and filtered yielding the desired seismic time history. 7 refs., 5 figs.

**35144** (DOE/ER/14079–10) **Three-dimensional explicit depth migration via McClellan transformations on hexagonal sampling grids.** Hedley, J.P. Colorado School of Mines, Golden, CO (United States). Center for Wave Phenomena. Jun 1991. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14079. (CWP–110). Order Number DE91017370. Source: OSTI; NTIS; GPO Dep.

The computational cost of three-dimensional depth migration depends almost entirely on the cost of depth extrapolation. Each frequency of a 3-D seismic wavefield can be extrapolated by two-dimensional filters that vary spatially according to frequency and velocity. 2-D extrapolation filters are efficiently designed and implemented by use of McClellan transformations. McClellan transformations convert 1-D extrapolation filters to approximately circularly symmetric 2-D extrapolation filters at computational cost that is proportional to the number of unique coefficients, N, in the 1-D extrapolation filters. In contrast, the cost of direct convolution of 2-D extrapolation filters is proportional to $N^2$. Imaging of steep digs requires long extrapolation filters, i.e., large N, making direct 2-D convolution very expensive. Although efficient, McClellan transformations only approximate circularly symmetric 2-D filters for depth extrapolation. The accuracy of a 2-D extrapolation filter can be improved only at an increase in the cost of implementing that filter. By applying McClellan transformations on a hexagonal sampling grid, the accuracy of 2-D extrapolation filters can be improved at a reduction in cost. Furthermore, hexagonal sampling grids are the most efficient for spatially circularly band-limited seismic data, reducing the number of samples that are repeatedly processed during recursive, depth extrapolation. 17 refs., 30 figs.

**35145** (DOE/EV/72012–T1) **Geochemical baseline data, Youngs Bay, Oregon, 1974: Final report, 1 November 1973–30 April 1975.** McMechan, K.J. (ed.); Johnson, V.G.; Cutshall, N.H. Oregon State Univ., Corvallis, OR (United States). School of Oceanography. Apr 1975. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT06-76EV72012. Order Number DE92000530. Source: OSTI; NTIS; GPO Dep.

This report comprises one part of a final report to the Alumax Pacific Aluminum Corporation on the "Physical, Chemical and Biological Studies of Youngs Bay". The data reported herein are the product of the geochemical baseline section of the project. The primary objectives of the geochemical study were: to provide a

baseline record of fluoride and selected trace metal levels in Youngs Bay bottom sediment, to identify areas that might function as heavy metal traps, to attempt to determine the recent depositional history of sediment in the bay. In addition to these primary objectives, a number of secondary tasks were undertaken during the study. While time did not allow these additional studies to be carried to completion, preliminary results are included herein because of their potential usefulness in assessing the impact of environmental releases of fluoride to aquatic systems in the vicinity of Youngs Bay or elsewhere. This report is made up of two major sections. In the first, a description of sample collection and analytical procedures is followed by a discussion of the baseline results. Obvious vertical and horizontal patterns of elemental distribution are identified and their origins considered. Problems needed further research are also discussed. In the second section, the data are presented in interpretive, graphical form, as well as in tables. 35 refs., 29 figs., 14 tabs.

**35146** (DOE/ID–12118) **Climatography of the Idaho National Engineering Laboratory: Second edition.** Clawson, K.L.; Start, G.E.; Ricks, N.R. (eds.). National Oceanic and Atmospheric Administration, Idaho Falls, ID (United States). Air Resources Lab. 1 Dec 1989. 155p. Sponsored by USDOE, Washington, DC (United States); National Oceanic and Atmospheric Administration, Washington, DC (United States). Order Number DE91018697. Source: OSTI; NTIS; GPO Dep.

Second edition of IDO–12048 issued in 1966.

Numerous research and climatological reports have been published about the Idaho National Engineering Laboratory (INEL) by the Field Research Division of the Air Resources Laboratory, or the various agency names under which this office has operated. Several preliminary reports were prepared in the later 1940's which described the expected climatology of the INEL. The first series of reports using meteorological data acquired on-site was published during the time period from 1958 to 1960. A major addition to that original body of climatological literature was the first edition of the "Climatography of the National Reactor Testing Station." Each of these reports were written primarily to: (1) provide engineers, health physicists, scientists, and other researchers with a source of meteorological information pertinent to designing, locating, and operating nuclear reactors and support facilities, and (2) provide insight into the atmospheric aspects of health physics. The second edition of the INEL climatography builds significantly on the material found in its predecessor. It is not, however, intended to be a replacement of all preceding climatological documents. It also does not provide guidance describing methods whereby the climatological data are to be utilized. Nevertheless, most of the meteorological and climatological information needed for the purpose of assessing the location, the design, and the operation of facilities within the setting of the INEL are provided. 32 refs., 66 figs., 52 tabs.

**35147** (DOE/SF/15522–T1) **UCSD Geothermal Chemistry Program, FY 1989: Final annual progress report.** Weare, J.H. California Univ., San Diego, La Jolla, CA (United States). Dept. of Chemistry. [1989]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-85SF15522. Order Number DE91018951. Source: OSTI; NTIS; GPO Dep.

The behavior of concentrated brines cannot be predicted from first principle theories. However, because of the importance of these fluids to many industrial and natural processes, there has been a continuing effort to develop phenomenological approaches which can be parameterized from empirical data. The model we are developing incorporates the most successful of these proposed by Pitzer and co-workers. We have shown that using this approach we can create models of brine chemistry which are highly accurate. These models are parameterized by very careful fitting of experimental measurements and require extensive data sets. However, the required data is for systems of considerably less complication than those found in field applications and in many cases is readily available. 7 refs.

**35148** (EGG-BG–9249) **Strong ground motion data recorded at the Idaho National Laboratory during the 1983 Borah Peak, Idaho earthquake.** Jackson, S.M.; King, J.J.; Anderson, D.M.; Carpenter, G.S.; Adams, H.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1991. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE91018744. Source: OSTI; NTIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is located approximately 80 km southeast of the epicenter for the 1983 $M_S$ 7.3 Borah Peak Idaho earthquake. Thirteen strong-motion accelerographs located at various facilities around the INEL Site recorded strong-ground motions from the Borah Peak earthquake. The strong-motion records were digitized and processed resulting in corrected acceleration, velocity, and displacement time-histories and response and Fourier spectra. Peak horizontal accelerations had a range of 0.022 to 0.078 g for accelerographs located at free-field and basement sites. Values of 0.037 – 0.817 g were recorded at accelerographs located within structures above basement level. Peak vertical accelerations ranged from 0.16 (basement level) to 0.059 g (top of structures). The peak amplitudes of the response and Fourier Spectra occur in the 2 – 10 hz frequency range. Appendices include Borah Peak earthquake accelerograph data printouts. 8 refs., 4 figs., 7 tabs.

**35149** (EUR–13406) **Catalogue of European earthquakes with intensities higher than 4.** Van Gils, J.M. (Federal Institute for Geosciences and Natural Resources, Hannover (DE)); Leydecker, G. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 353p. Source: OSTI; NTIS (US Sales Only).

The catalogue of European earthquakes with intensities higher than 4 contains some 20 000 seismic events that happened in member countries of the European Communities, Switzerland and Austria. It was prepared on the basis of already existing national catalogues and includes historical data as well as present-day data. All historical data are harmonized as far as possible to the same intensity scale (MSK-scale) to make them suitable for computerization. Present-day data include instrumental and macroseismic data. Instrumental data are expressed in terms of magnitude (Richter scale) while macroseismic data are given in intensities. Compilation of seismic data can provide a basis for statistically supported studies of site selection procedures and the qualitative assessment of seismic risks. Three groups of seismic maps illustrate the content of the catalogue for different time periods and different intensities.

**35150** (INIS-BR–2698) **K-Ar cooling age profile from Joinville massif (PR and SC, Brazil) and Dom Feliciano belt (SC, Brazil) - Tectonics entanglement.** Siga Junior, O. (Sao Paulo Univ., SP (Brazil). Inst. de Geociencias); Basei, M.A.S.; Kawashita, K. Sociedade Brasileira de Geologia, Recife, PE (Brazil). Nucleo do Nordeste. 1990 14p. (In Portuguese). (CONF-9010404–: 36. Brazilian congress of geology, Natal (Brazil), 28 Oct - 1 nov 1990). Order Number DE92601128. Source: OSTI; NTIS (US Sales Only); INIS.

A K-Ar cooling age profile using different minerals from metamorphic rocks of the Joinville Massif and Dom Feliciano Belt is presented. Three main geochronological domains are distinguishable, from NW to SE: (1) Northern part of the Joinville Massif (NJM); (2) Southern part of the Joinville Massif (SJM) and (3) Dom Feliciano Belt (DBF). Geochronological domains 1 and 3 yielded K-Ar values in the range 800-500 Ma and 700-500 Ma, respectively, which show a clear influence of the Brasiliano Cycle. The granulite terrain comprising the SMJ exhibits ages older than 1700 Ma, indicating that this area was cool during the Late Proterozoic Brasiliano Cycle. The SJM and NJM limit is marked by a rapid Transition from Early Proterozoic ages in the SJM to Late Proterozoic ages in the NJM. On the other hand the contact between the SJM and DFB is interpreted as a thrust at a high, relatively cool crustal level. (author).

**35151** (LBL–29700) **Earth Sciences Division annual report 1990.** Lawrence Berkeley Lab., CA (United States). Jun 1991. 197p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000647. Source: OSTI; NTIS; GPO Dep.

This Annual Report presents summaries of selected representative research activities grouped according to the principal disciplines of the Earth Sciences Division: Reservoir Engineering and Hydrogeology, Geology and Geochemistry, and Geophysics and Geomechanics. Much of the Division's research deals with the physical and chemical properties and processes in the earth's crust, from the partially saturated, low-temperature near-surface

environment to the high-temperature environments characteristic of regions where magmatic-hydrothermal processes are active. Strengths in laboratory and field instrumentation, numerical modeling, and in situ measurement allow study of the transport of mass and heat through geologic media – studies that now include the appropriate chemical reactions and the hydraulic-mechanical complexities of fractured rock systems. Of particular note are three major Division efforts addressing problems in the discovery and recovery of petroleum, the application of isotope geochemistry to the study of geodynamic processes and earth history, and the development of borehole methods for high-resolution imaging of the subsurface using seismic and electromagnetic waves. In 1989 a major DOE-wide effort was launched in the areas of Environmental Restoration and Waste Management. Many of the methods previously developed for and applied to deeper regions of the earth will in the coming years be turned toward process definition and characterization of the very shallow subsurface, where man-induced contaminants now intrude and where remedial action is required.

35152 (ORNL/TM–11897) **Assessment of the 1988 Saguenay earthquake: Implications on attenuation functions for seismic hazard analysis: Revised draft report.** Toro, G.R. (Risk Engineering, Inc., Golden, CO (United States)); McGuire, R.K. Oak Ridge National Lab., TN (United States); Pickard, Lowe and Garrick, Inc., Newport Beach, CA (United States). Sep 1991. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000453. Source: OSTI; NTIS; GPO Dep.

This study investigates the earthquake records from the 1988 Saguenay earthquake and examines the implications of these records with respect to ground-motion models used in seismic-hazard studies in eastern North America (ENA), specifically, to what extent the ground motions from this earthquake support or reject the various attenuation functions used in the EPRI and LLNL seismic-hazard calculations. Section 2 provides a brief description of the EPRI and LLNL attenuation functions for peak acceleration and for spectral velocities. Section 2 compares these attenuation functions the ground motions from the Saguenay earthquake and from other relevant earthquakes. Section 4 reviews available seismological studies about the Saguenay earthquake, in order to understand its seismological characteristics and why some observations may differ from predictions. Section 5 examines the assumptions and methodology used in the development of the attenuation functions selected by LLNL ground-motion expert 5. Finally, Section 6 draws conclusions about the validity of the various sets of attenuation functions, in light of the Saguenay data and of other evidence presented here. 50 refs., 37 figs., 7 tabs.

35153 (UCRL-JC–108142) **Nonlinear attenuation effects outside the zone of macroscopic failure.** Bonner, B.P.; Wanamaker, B.J. Lawrence Livermore National Lab., CA (United States). 6 Aug 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-890398–3: DOE/LLNL symposium on explosion-source phenomenology, Lake Tahoe, CA (United States), 14-16 Mar 1989). Order Number DE91018722. Source: OSTI; NTIS; GPO Dep.

Laboratory evidence unambiguously shows that the mechanical response of rock of low confining pressure is nonlinear, meaning that attenuation is strain-amplitude-dependent, for strains between $\sim 10^{-6}$ and those sufficient to cause permanent damage, $10^{-3}$ to $10^{-2}$. We compare the magnitude to nonlinear attenuation for soils, microscopically cracked granite, and macroscopically fractured granite. A compilation of data for attenuation in soils from the civil engineering literature documents the strong nonlinear response in these materials over the strain range $10^{-6}$ to $10^{-3}$. Nonlinear soil response would be most important in near surface layers. We show direct evidence that fatigue microcracking resulting from high-frequency and ultrasonic measurement techniques may lead to systematic overestimates of nonlinear attenuation. New data for attenuation due to sliding on a single macrofracture in granite shows that large attenuation (up to $Q^{-1} = 0.1$) can occur at strains of $5 \times 10^{-4}$ at low normal stress. Measurable nonlinear response attributable to the fracture persists to strains near $10^{-6}$ and to normal stresses corresponding to overburden pressures at typical burial depths for underground explosions. 32 refs., 6 figs.

35154 (CEA-N–2660) **Backgrounds in the Gallex solar neutrino experiment.** Stolarczyk, T. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Sciences de la Matiere; Paris-11 Univ., 91 - Orsay (France). Mar 1991. 196p. (In French). Order Number DE92707157. Source: OSTI; NTIS (US Sales Only).

GALLEX is a radiochemical solar neutrino experiment installed in the Gran Sasso Underground Laboratory (Italy). It uses 30 tons of gallium in the form of a gallium chloride solution. The observation of the decay of $^{71}$Ge produced by neutrino interactions on the $^{71}$Ga atoms determines the solar neutrino flux. Since the reaction threshold is 233 keV, GALLEX is sensitive to neutrinos emitted by the initial hydrogen fusion reaction. GALLEX should contribute to the solution of the Solar Neutrino Problem, dating from the first results of the Chlorine Experiment in 1968 and confirmed in 1989 by Kamokiande II. A production rate of 1.2 germanium atom per day is expected. All backgrounds which may produce $^{71}$Ge atoms in the gallium tank, essentially $^{71}$Ga(p, n)$^{71}$Ge reactions, must therefore be carefully evaluated. In these reactions protons originate in cosmic muon interactions or fast neutron interactions on hydrogen or chlorine atoms in the solution. The muon induced background is calculated using the muon flux in the underground laboratory measured by the MACRO experiment and the germanium production cross section measured at CERN with a muon beam. The neutron background is measured using a calcium nitrate solution detector ($n + {}^{40}Ca \rightarrow {}^{37}Ar + \alpha$) where the $^{37}$Ar radio-isotopes are extracted and counted in the same way as in the chlorine experiment. These two phenomena induce a total background which does not exceed 3% of the signal, provided that the number of germanium atoms produced by solar neutrinos agrees which the prediction of standard solar models.

Two relativistic extended objects are considered. One of them describes the motion of two similar material points with constant gravitation. Another one leads to the de Sitter motion of the world.

As follows from the least action principle, extended relativistic structures of finite dimensions in the form of de Sitter Universe and spherical membranes can exist and develop in the metric space-time. In this case the de Sitter Universe radius depends on the dimension of space-time. 20 refs.

Theory of tide forces square by vector radius is presented. The mechanism of $10^{18}$ time gravitational wave pressure increase in case of radiation from pulsars and $10^{15}$ time one in case of standard burst of radiation from astrophysical catastrophe is proposed. This leads to secular shifts of longitudinally free receivers by $10^{-16}$ cm during $10^5$ s in the first case and by $10^{-19}$ cm during 10 s in the second one. A possibility of increase effect modulation is available. It is indicated that it is possible to construct a device which produces more energy at the expense of square tide forces than at the expense of linear ones. 21 refs.

Design of a gravitational antenna for kHz range on the base of Mach-Zehnder interferometer, each arm of it applying one-mode $28 \times 10^3$ m length optical fiber, is presented. The antenna is planned to be commissioned in three stages. At the first one a quartz optical fiber produced by domestic industry will be used in the antenna. In this case the calculated antenna sensitivity at indoor temperature by shot noises will make up $\sim 6 \times 10^{-18}$ and by thermal ones - $\sim 10^{-15}$. Under liquid helium temperature and fiber submersion to dispersion medium the thermal noise is reduced down to the value of $\sim 10^{-20}$. 19 refs.; 3 figs.

(CONF-8810552–: Workshop on development and construction of gravitational wave emitter and detector, Dubna (USSR), 11-13 Oct 1988). In *Proceedings of workshop on the development and construction of gravitational wave emitter and detector.* 154p. Order Number DE92001311. Source: OSTI; NTIS (US Sales Only); INIS.

Fluctuation of light phase occurence in a fiber Mach-Zehnder interferometer used as an antenna for gravitational wave recording in a kHz frequency range is discussed on the base of statistical physics and thermodynamics. Thermodynamic fluctuation of entropy and pressure appears to be the main source of phase fluctuation. It is shown that these fluctuations limit the sensitivity of opticofiber antenna. In particular, under 30 km arm length in interferometer and 10 K temperature the antenna sensitivity to dimensionless amplitude of a gravitational wave makes up $\sim 10^{-20}$. 9 refs.

The problem of gravitation radiation excitation from monocrystal under effect of intensive light wave is considered. It is shown that the amplitude of outlet gravitation pulse radiation from the crystal depends on the optical properties of the crystal. The more the share of crystal volume with initial optical defects and radiation distortions of refraction index homogeneity and the crystal absorption index, the lower the gravitational field intensity on the crystal axis is. 17 refs.; 4 figs.

**35163** (JINR-D–4-89-221, pp. 147-152) **Possibility of gravitational wave detector production on the base of light diffraction.** Segizboev, T.I. (AN Tadzhikskoj SSR, Dushanbe (USSR). Fiziko-Tekhnicheskij Inst.). Joint Inst. for Nuclear Research, Dubna (USSR). 1989. (In Russian). (CONF-8810552–: Workshop on development and construction of gravitational wave emitter and detector, Dubna (USSR), 11-13 Oct 1988). In *Proceedings of workshop on the development and construction of gravitational wave emitter and detector.* 154p. Order Number DE92001311. Source: OSTI; NTIS (US Sales Only); INIS.

Gravitational wave detector based on the light diffraction is proposed. Under the gravitation wave incidence on an elastic rod standing acoustic oscillations are excited in it, which are then used as a diffraction grating for the light scattering. A detailed mathematical analysis of this detector is given. 1 ref.

**35164** (Juel–2446) **Chemical problems in comet simulation experiments KOSI. Contributions of Institut fuer Chemie 1 (Nuklearchemie), Forschungszentrum Juelich to Schwerpunktprogramm 'Kleine Koerper im Sonnensystem' of Deutsche Forschungsgemeinschaft DFG for the period 15 February 1989 to 17 February 1991.** Roessler, K. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie 1 - Nuklearchemie; Deutsche Forschungsgemeinschaft, Bonn (Germany). Feb 1991. 55p. (In German). Contract DFG Ro 724/1-1. Order Number DE92714420. Source: OSTI; NTIS (US Sales Only).

The report informs on preparation of analog material for the comet simulation experiments KOSI in the big Space Simulator Chamber of Institut fuer Raumsimulation DLR-Koeln, and the preceding laboratory studies in Juelich. In three experiments KOSI-5 to 7, 'organic solids' were introduced: $CH_3OH$, charcoal, and kerogen. The cryohandling in glove boxes with $LN_2$ baths and the analysis of unirradiated standard and insolated main samples are described. Visual inspection of the interior of the analogs, analysis of concentration profiles of the components and test of material strength by drilling revealed an interesting phenomenon: Volatile components such as $CO_2$ or $CH_3OH$ do not only diffuse outoff the mineral-ice sample, but also into its colder interior. This inward diffusion leads to enrichment layers characterized by formation of brilliant crystallites or solidification to inner crusts. These layers are arranged in a way that the more volatile compounds recrystallize deeper in the interior, such as in a kind of 'thermochromatography'. The solidification by condensation in the interior is the stronger, the higher the content of solid material (minerals, carbon, kerogen) and negligible in pure $H_2O$-$CO_2$-ice samples. A VUV-source is applied in the space simulator to complete the light spectrum with respect

to the photons with kinetic energies up to 10 eV which are characteristic for the real solar spectrum but do not exist in the light from Xenon-lamps which constitute the source for the artifical sun in KOSI. Single constituents of the analog samples are tested for their behaviour during photolysis in a small vacuum chamber in KFA Juelich. Optical spectroscopy data of some of the solid constituents (olivine, montmorillonite, kerogen) of the KOSI-7 material is reported for many spectroscopic methods (transmission, reflexion, FTIR, FTRAMAN, photoacoustic detection etc.). (orig.).

**35165** (KEK-PR–90-1) **Proceedings of the fourth workshop on elementary-particle picture of the universe.** Hikasa, Ken-ichi; Nakamura, Takashi; Ohshima, Takayoshi; Suzuki, Atsuo (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). 1990. 285p. (CONF-8911321–: 4. workshop on elementary-particle picture of the universe, Tateyama (Japan). 22-25 Nov 1989). Order Number DE92713849. Source: OSTI; NTIS (US Sales Only); INIS.

The Fourth Workshop on Elementary-Particle Picture of the Universe was held at Tateyama National Rest House from November 22 to 25, 1989. The main purpose of this workshop focuses on most of current experimental and theoretical activities in non-accelerator particle physics and astrophysics. It is also aimed to promote effective collaborations between experimentalists and theorists in these fields. The solar neutrino problem and the dark matter problem are the most exciting subjects in the astroparticle physics. They threw some doubts on the standard theories of astrophysics and also particle physics. We picked up both problems in this workshop as main themes, and discussed what they are at present and how they can be solved. Cosmology gives stringent constraints on particle properties which are frequently plausible candidates to solve the astrophysical problems. However, it is scarce to argue about how to determine the cosmological parameters and their ambiguities. We had some talks for this subject given by astronomers. New experimental results and detector developments were also presented. The atmosphere of workshop was informal, and there were extensive discussions on the above subjects. We got the confirm response that experimental and theoretical research activities in astroparticle physics were increasing here in Japan. (J.P.N.).

**35167** (LA-UR–91-2945) **Magnetic topology of coronal mass ejections based on ISEE-3 observations of bidirectional electron fluxes at 1 AU.** Phillips, J.L.; Gosling, J.T.; McComas, D.J.; Bame, S.J.; Feldman, W.C. Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by Department of Defense, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9109254–2: Solar connection with transient interplanetary processes (SOLTIP), Castle Liblice (Czechoslovakia), 30 Sep - 5 oct 1991). Order Number DE92000250. Source: OSTI; NTIS; GPO Dep.

The solar wind electron heat flux is carried primarily by superthermal "halo" electrons with energies at 1 AU of ~80 eV and greater. These halo electrons typically are beamed antisunward along the IMF, indicating effective magnetic connection to the Sun only in one direction. However, ISEE-3 electron observations at 1 AU show that counterstreaming halo beams, suggesting closed magnetic structures, prevail within CMEs. These structures might be magnetic "tongues," tied to the Sun at both ends, magnetically detached plasmoids, or perhaps complex flux rope structures. We present the results of analysis of ISEE-3 electron observations within 39 CMEs. Parameters analyzed include: the asymmetry between the counterstreaming beams, control by the IMF orientation, and the variation of the electron distributions as a particular CME convects past the spacecraft. We find that some CMEs contain nearly symmetric electron beams, while others are strongly asymmetric, and that beam propagating most nearly antisunward is generally dominant. The more nearly radial the IMF the greater is the symmetry between outward and inward beams. Trends observed as CMEs propagate past the spacecraft probably result primarily from the compression of the leading edge. We present examples of a previously unreported "strahl-on-strahl" distribution, suggesting continued magnetic connection to the corona, in which a narrow antisunward beam is superimposed on a broader beam. Preliminary results show that such spectra are present in a substantial fraction of the observed CMEs. Taken as a whole, our results appear to favor a tongue or flux rope scenario rather than a detached plasmoid.

**35168** (LA-UR–91-2963) **On adaptive grid computations of variable stars.** Cox, A.N.; Deupree, R.G.; Gehmeyr, M. Los Alamos National Lab., NM (United States). [1991]. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9105252–2: 11. annual Center for Nonlinear Studies (CNLS) conference, Los Alamos, NM (United States), 20-24 May 1991). Order Number DE92000221. Source: OSTI; NTIS; GPO Dep.

We show that the use of an implicit adaptive-grid technique is an efficient and up-to-date approach for the calculations of radial oscillations in variable stars. We chose as an illustrative example the radiative envelope of an RR Lyrae variable. For the hydrostatic initial model we compare the Lagrangean ratioed zoning with an adaptive-grid rezoning. We show that the adaptive-grid yields an optimal distribution of the mesh points in the sense that the relevant physical features, the H– and He 1–, He 2– ionization zones, are well resolved. For the hydrodynamical evolution we present the full-amplitude model for both the Lagrangean and adaptive-grid computations. We perform a detailed comparison and show that the adaptive-grid method yields limit cycle solutions that are substantially improved over the Lagrangean grid model. This is due to the fact that the Lagrangean mesh sweeps through the ionization zones twice during one oscillation period, whereas the adaptive-mesh resolves them and tracks them continuously. The results are, in particular, smooth radial velocity and light curves. Beyond a physically better defined solution we also observe larger time steps for the convergence towards the limit cycle and for the evolution during one period. 12 refs., 13 figs., 5 tabs.

**35169** (UCRL-JC–108046) **Radiation-driven evolution of low-mass x-ray binaries and the formation of millisecond pulsars.** Tavani, M. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 8 Aug 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9101113–1: X-ray binaries and the formation of binary and millisecond radio pulsars, Santa Barbara, CA (United States), 21-25 Jan 1991). Order Number DE92000123. Source: OSTI; NTIS; INIS; GPO Dep.

Recent data on low-mass X-ray binaries (LMXBs) and millisecond pulsars (MSPs) pose a challenge to evolutionary theories which neglect the effects of disk and comparison irradiation. Here we discuss the main features of a radiation-driven (RD) evolutionary model that may be applicable to several LMXBs. According to this model, radiation from the accreting compact star in LMXBs "vaporizes" the accretion disk and the companion star by driving a self-sustained mass loss until a sudden accretion-turn off occurs. The main characteristics of the RD-evolution are: (1) lifetime of RD-LMXB's is of order $10^7$ years or less; (2) both the orbital period gap and the X-ray luminosity may be consequences of RD-evolution of LMXB's containing lower main sequence and degeneration companion stars; (3) the companion star may transfer mass to the primary even if it underfills its Roche lobe; (4) a class of recycled MSPs can continue to vaporize the low-mass companions by a strong pulsar wind even after the accretion turn-off; (5) the RD-evolutionary model resolves the apparent statistical descrepancy between the number of MSPs and their LMXB

progenitors in the Galaxy. We discuss the implications of the discovery of single MSPs in low-density globular clusters and the recent measurements of short orbital timescales of four LMXBs. 34 refs., 3 figs., 2 tabs.

Recently measurements have been made of the temperature dependence of long distance intramolecular electron transfer reactions in molecules in which donor and acceptor groups are held at a fixed distance apart. For very highly exoergic electron transfer reactions, the rates show a remarkable independence of temperature. This temperature independence can be predicted quite precisely from the results of previous experiments which measured only the dependence of rates on free energy change. The temperature dependence can be ascribed to "nuclear tunneling" in high frequency vibrational modes which are coupled to the electron transfer reaction. While this is not surprising, the dominance of even a small coupling to high frequency modes in determining the temperature dependence is surprising. The importance of the high frequency modes is likely to be apparent in other contexts, particularly cases in which "dynamic solvent" effects occur for electron transfer reactions in highly viscous media. 63 refs., 6 figs.

**35171** (CONF-9108105–1) **Progress in collisions of multiply charged ions.** Phaneuf, R.A. Oak Ridge National Lab., TN (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 8. topical conference on atomic processes in plasmas; Portland, ME (United States); 25-29 Aug 1991. Order Number DE92000735. Source: OSTI; NTIS; INIS; GPO Dep.

The increasing power and availability of supercomputers during the last decade led to significant progress in the theory of multicharged ion interactions. However, important tests of many theoretical predictions were lacking, and have become possible only quite recently as new capabilities have been realized in the laboratory. This paper broadly surveys some of these experimental developments, and their impact on our understanding of collisional interactions of multicharged ions. The scope is limited to measurements made with monoenergetic beams. 35 refs., 6 figs.

The isotope shifts and hyperfine structure have been measured for a series of polonium isotopes ($^{200}$Po, $^{202}$Po and $^{204}$Po to $^{210}$Po) by laser induced fluorescence on an atomic beam. The optical transition chosen for the investigations was the E1 transition $6p^4\ ^3P_2 \rightarrow 6p^3 7s\ ^5S_2$ with the longest possible wavelength $\lambda$=255.8 nm. In order to induce this UV transition, laser intracavity frequency doubling was applied. For that purpose a commercial ring dye laser system has been considerably modified, in particular the frequency selection scheme has been changed; the rebuilt laser system, as used in this work, is described. The measurements of the hyperfine structure led to the first determination of the nuclear magnetic dipole moment of $^{209}$Po. From the measured isotope shifts relative changes of the nuclear mean square charge radii $\delta\langle r^2\rangle$ have been estimated. Applying a calibration based on a nuclear model, absolute $\delta\langle r^2\rangle$ values have been determined. The observed features are discussed in terms of theoretical predictions and compared with experimental data for neighboring elements. (orig.).

National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185–: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications*. 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

We tried reduction of low energy components in pulse ion beams with self-crowbar switch of which operation was achieved by expansion of electrode plasmas in a small MITL. The experiments were carried out with the small MITL (self-crowbar switch) and the 'Inverse Pinch Ion Diode'. From the experimental results, the times required for dropping of pulse high voltage were shortened from 40 to 15 ns. As the result of this shortening, the ions accelerated at a relatively low voltage decreased, and the energy ranges of proton beams were reduced from 60 to 30 keV. (author).

Thesis. Submitted to University of California, Davis.

One of the most striking discoveries of the past decade in materials science is the class of cuprate superconductors with high transition temperatures ($T_c$). In spite of the considerable success in identifying new cuprate superconductors, little is known of the fundamental interactions responsible for the phenomenon. There are two distinct features of these materials as a group, which might offer clues. First, they exhibit a large oxygen polarizability suggesting a strong electron-phonon interaction. It was this feature that led Bednorz and Mueller to focus on copper oxides as possible superconductors, and it is the electron-phonon interaction that is the essential component of the Bardeen-Cooper-Schriefer (BCS) theory of conventional superconductivity. Until recently, the small isotope effects measured (and references therein) have cast doubt on this explanation of superconductivity in these cuprates. While recent tunneling and neutron scattering measurements have revived the possibility of an electron-phonon explanation, they can not account for the high $T_c$ alone. The second distinct feature of these cuprates is that they are doped Mott-Hubbard insulators. The origin of the insulating behavior in undoped materials of this class has never been fully understood. Getting superconductivity, and moreover high temperature superconductivity, by doping such materials is equally mysterious, and has led many to suspect that a single physical principle is responsible for both unusual properties observed in this class of materials. The present thesis focuses on this Mott-Hubbard connection, and specifically on the electronic structure of such materials. Regardless of the pairing mechanism, a proper understanding of the electronic structure of these materials is essential to the identification of the carriers that will be involved in the pairing. 100 refs., 30 figs., 21 tabs.

**35175** (ANL–90/51) **Local interfacial area concentration measurement in bubbly flow.** Ishii, M. (Argonne National Lab., IL (United States)); Revankar, S.T. Argonne National Lab., IL (United States). Oct 1990. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE91018702. Source: OSTI; NTIS; GPO Dep.

The interfacial area concentration is one of the most important parameters in a thermal-hydraulic analysis of two-phase flow systems based on the two-fluid model. A theoretical foundation of the measurement method for the time averaged local interfacial area using a double sensor probe is presented. Based on this theory, the double sensor resistivity probe was employed for the measurement of local properties of two-phase flow such as the interfacial velocity, local interfacial area concentration and void fraction in vertical air-water bubbly flow. Experimental data are presented on the radial profiles of the void fraction, bubble velocity, bubble chord length

and interfacial area concentration at various gas flow rates. In addition to these, some statistical information on turbulent motions of bubbles are presented. Each of the double sensors are checked against the global void measurement using a differential pressure. The result is very satisfactory. Furthermore, the area averaged void fraction, and the interfacial area concentration obtained from the double sensor probe measurement compared very well with the photographic measurements. The results show that the double sensor probe method is accurate and reliable for the local measurements of interfacial area and void fraction in bubbly two-phase flow. Results of the measurement of interfacial area concentration with the double sensor probe in forced flow loop are presented for bubbly flow at different liquid flow rates. The data indicate that the radial profiles of the interfacial area concentration show similar dependence on the liquid and gas flow rate like radial profiles of void fraction in the bubbly flow regime. 38 refs., 62 figs., 2 tabs.

This report briefly discusses research on computational methods for gas dynamics and solidification, and mesh generating techniques. (LSP)

**35178** (DOE/ER/25084–2) **The modeling of complex continua: Fundamental obstacles and grand challenges: Progress report.** State Univ. of New York, Albany, NY (United States). Research Foundation. Sep 1991. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER25084. Order Number DE91018806. Source: OSTI; NTIS; GPO Dep.

The focus of this research program is to achieve quantitatively correct computations in the modeling of complex continua. The central theme of the effort is to continue the development of a coherent approach that is independent of any one particular application. This is done by absracting important mathematical concepts and computational methods from individual applications which generalize to all applications involving complex continua. The generic difficulties in the modeling of continua that guide this abstraction are associated with (a) multiple length and time scales, often involving sharply defined internal layers of boundaries, (b) high dimensional descriptions of the solution variables, (c) microstructures such as droplets, vortices and crystal defects, and (d) chaotic or random phenomena described by a statistical formulation. The scientific goal is achieved by identifying critical research areas and, within them, focusing the development of the theory necessary to support computation. The mathematical concepts and computational methods thus developed are generalized where possible and added to an integrated framework for general use in complex continua problems.

**35179** (EGG-M–91257) **Self-consistent modeling of plasma spraying processes.** Chang, C.H.; Ramshaw, J.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-910867–1: 10. international symposium on plasma chemistry, Jerusalem (Israel), 4-9 Aug 1991). Order Number DE91018820. Source: OSTI; NTIS; INIS; GPO Dep.

A new numerical model is described for simulating thermal plasmas containing entrained particles, with emphasis on plasma spraying applications. The plasma is represented as a continuum multicomponent chemically reacting ideal gas, while the particles are tracked as discrete Lagrangian entities coupled to the plasma. Computational results are presented from a transient simulation of the melting of alumina particles injected into an axisymmetric pure argon plasma jet. 13 refs., 5 figs.

**35180** (LBL–31200) **Capillary surfaces in exotic containers.** Concus, P. (Lawrence Berkeley Lab., CA (United States)); Finn, R. Lawrence Berkeley Lab., CA (United States). Jul 1991. 4p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-910786–1: International symposium on hydromechanics and heat/mass transfer in microgravity, Kama River (USSR), 6-11 Jul 1991). Order Number DE92000956. Source: OSTI; NTIS; GPO Dep.

A survey is presented of results to date for capillary surfaces in "exotic" containers. These containers have the property that each one admits a continuum of distinct equilibrium free surfaces, all bounding with the container walls the same volume of fluid, making the same contact angle at the trip interface curve, and having identical mechanical energies. The containers can be so designed that they are themselves axially symmetric but that the fluid configurations of minimizing energy cannot be axially symmetric. 9 refs., 2 figs.

**35181** (PNL-SA–19765) **Properties of liquid water and carbon dioxide from constant temperature-constant temperature molecular dynamics.** Palmer, B.J. Pacific Northwest Lab., Richland, WA (United States). Aug 1991. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9108164–1: Chemistry and physics of liquids conference, Plymouth, NH (United States), 12-16 Aug 1991). Order Number DE91018219. Source: OSTI; NTIS; GPO Dep.

Although most experimentalists control experimental conditions by fixing the temperature and pressure, most molecular dynamics (MD) simulations of complicated systems are done by fixing the volume and energy. The energy is easily determined by scaling the atomic velocities to give the desired temperature, but the volume is another matter. Determining the correct volume corresponding to a particular pressure using a series of constant energy simulations is at best a tedious business. It is further complicated by the enormous pressure fluctuations that are present in a system the size of most MD simulations. Fortunately, recent advances in MD simulation techniques, primarily by Andersen and Nose, promise to simplify this process considerably. Constant pressure-constant temperature molecular dynamics (NPTMD) simulations can be used to prepare systems at a previously specified temperature and pressure in a single simulation. A great deal of equilibrium information can also be obtained at the same time, as well as some dynamical quantities. The use of NPTMD in modeling molecular fluids is investigated by looking at several models of water and carbon dioxide. 17 refs., 4 figs., 3 tabs.

**35182** (UCRL-CR–107853) **Microchannel cooling with subcooled boiling: Executive summary of first year's results: Final report No. 1.** Hoffman, M.A. California Univ., Davis, CA (United States). Sep 1990. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE91019009. Source: OSTI; NTIS; GPO Dep.

During the first year's effort, we started with we felt to be the most critical problem: namely, the prediction of the point of bubble departure, BD (also referred to as the point of onset of significant net vapor generation, OSNVG). Mr. Stetson started work on the project in January 1990, when the funding was officially received, and spend some time becoming acquainted with the SCB-1A code. Then he examined the models of Saha & Zuber, Levy and Staub for the location of the BD point and the models of Rohani, Levy and Staub for the size of the bubble at the BD point. (1) At the present time, the best model to use to predict the ONSVG point for sub-millimeter diameter tubes appears to be the Saha-Zuber correlation. Data in channels with hydraulic diameters from about 24 mm down to about 1 mm agree with the correlation to within about

±25%. (2) It is not at all clear which is the best correlation to use to predict the average bubble diameter at the OSNVG point in sub-millimeter diameter tubes. We have decided to retain the modified Rouhani correlation in the code for the time being, recognizing that it is probably inadequate. We will also compare predictions of the heat transfer performance in small sub-millimeter diameter tubes using the bubble departure diameters from the modified Rouhani correlation to those using modified Staub model. 16 refs., 24 figs.

**35183** (VTT-TIED–1207) **Magnetic fluids and their applications.** Saeynaetjoki, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Konepajan Tuotantotekniikan Lab.). Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Feb 1991. 31p. (In Finnish). Order Number DE92704012. Source: OSTI; NTIS (US Sales Only).

Magnetic fluids consist of carrier fluid, magnetically active particles and surfactant on each particle preventing the agglomeration of the particles. The fluids acting in the presence of the magnetic field like the ferromagnetic materials but remaining their fluid properties are prepared in this way. Potential applications of these fluids are magnetic separation, ink jet printing, sealing, damping, lubrication and heat transfer. So far, the industrial applications of the magnetic fluids are in the seals and bearings of the computer hard disk drives, in the heat transfer and damping of loudspeakers and in the damping of step motors. The other applications are in laboratory and research stage.

This report discusses research being conducted at the University of Arizona on the theory and phenomenology of strong and weak interaction high energy physics. (LSP)

**35185** (KFK–4841) **Report on research and development results in 1990 by the Institute for Nuclear Physics.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Kernphysik. Mar 1991. 18p. (In German). Order Number DE92714354. Source: OSTI; NTIS (US Sales Only); INIS.

Part I and III of the Institute of Nuclear Physics mainly work in different fields of nuclear and elementary particle physics, with problems bordering astrophysics being in the foreground. A joint research project of the two sections consists in studying cosmic radiation in the energy range above $10^{14}$ eV by means of large-scale detector systems on the earth's surface. The composition of primary radiation, the existence of point sources of high-energy radiation, and their position in space are questions of priority interest. (orig./HP).

**35186** (ANL-HEP-CP–90-122) **First results from the Soudan 2 proton decay experiment.** Litchfield, P.J. Soudan 2 collaboration. Argonne National Lab., IL (United States). High Energy Physics Div. 21 Nov 1990. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9010128–5: 14. Europhysics conference on nuclear physics: rare nuclear decays and fundamental processes, Bratislava (Czechoslovakia), 22-26 Oct 1990). Order Number DE91018596. Source: OSTI; NTIS; INIS; GPO Dep.

Soudan 2 is a 1000 ton iron drift calorimeter designed to search for proton decay with a sensitivity to the lifetime divided by branching fraction of up to $5 \times 10^{32}$ years in all detectable decay modes. Current experiments have already yielded limits at this level in distinctive, all charged, two body modes such as $e^+\pi^0$. However in many modes containing a neutrino or having a high multiplicity the limits are an order of magnitude or more lower because their selections are saturated by background produced by atmospheric neutrino interactions. Soudan 2 collects much more information per event than previous experiments. This allows a better discrimination against background, enabling essentially background free samples of all modes to be defined at the above sensitivity. Soudan 2 began operations in mid-1988 when 275 tons of detector was installed. Currently 580 tons is operational and it is expected that the full 1000 ton detector will be completed in 1992. During the installation work the detector has operated for physics at about 60% overall efficiency. This early data has enabled us to develop software and analysis procedures which are now in routine use to collect contained events. As of mid September 1990 Soudan 2 had an integrated total exposure of 0.36 kton-years of which 0.29 kton-years was within a fiducial volume defined by 20cm cuts around the edge of the detector and 50cms in the drift direction. Physics topics being studied include: (a) Contained interactions for the study of proton decay and atmospheric neutrino oscillations. (b) Single muons in search for astronomical point sources of cosmic rays. (c) A search for magnetic monopoles passing through the detector. (d) Multiple muons in coincidence with a surface detector of atmospheric showers to study the composition and origin of cosmic rays. Since this a rare decay conference, this paper will concentrate on the contained event data.

**35187** (ANL-HEP-CP–91-76) **Identifying the origin of new gauge bosons at the SSC and LHC.** Hewett, J.L. (Argonne National Lab., IL (United States)); Rizzo, T.G. Argonne National Lab., IL (United States). Aug 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;W-7405-ENG-82. (CONF-910881–11: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000290. Source: OSTI; NTIS; INIS; GPO Dep.

The ability of an SCD-like detector to identify the origin of a new neutral gauge boson $Z_2$, once it has been discovered at the SSC and/or LHC, is examined. 9 refs., 3 figs.

**35188** (ANL-HEP-TR–91-70) **B-jet tagging using electrons at SDC.** Wicklund, A.B. Argonne National Lab., IL (United States). 14 Aug 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC–91-00051). Order Number DE91018547. Source: OSTI; NTIS; INIS; GPO Dep.

This note examines b-jet tagging at SDC, using semileptonic b $\rightarrow e\nu$ X electron decays. The main application for this tagging capability would be in the study of Top decays. Thus, we consider Top decays in a "reasonable" mass range (e.g. 110 < Mtop < 170). For completeness, we also consider inclusive QCD production of b-quarks. We are mainly interested in the effects of hadron calorimeter segmentation on the electron efficiency, assuming that similar algorithms are used for electron ID at SDC as at CDF. We review the following topics: kinematics of top decay; kinematics of semileptonic b-decay; effects of Had/EM cuts on electron ID, as a function of b-decay kinematics and calorimeter segmentation; overall efficiency for b-tagging from Top decay and inclusive b-production. We consider only the barrel region in our simulation, e.g. $\eta < 1.4$. 19 figs.

**35189** (ANL-HEP-TR–91-74) **$Z^0 \rightarrow$ hadrons in SDC.** Wicklund, A.B. Argonne National Lab., IL (United States). 30 Aug 1991. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC–91-00081). Order Number DE92000294. Source: OSTI; NTIS; INIS; GPO Dep.

We report on a study of hadronic $Z^0$ decays at high $P_t(P_t>500$ GeV/c), at 40 TeV CM energy. Our goal here is to understand the effects of the kinematics of $Z^0$ decay, especially the Lorentz boost, on detection issues. We used an ISAJET sample of Drell Yan events, requiring the $Z^0$ to have pseudorapidity ($\eta$) in [-1.5,1.5] and $P_t>500$ GeV/c. ISAJET forces the $Z^0$ to decay to two primary partons, which then cascade by gluon and quark emission to stable hadrons. We excluded $Z^0 \rightarrow \nu\bar{\nu}$ decays. In about 10% of the hadronic decays, significant energy is lost due to neutrino emission from heavy quarks, so that the hadronic mass is significantly less

than the $Z^0$ mass generated; these events were not explicitly removed. We treated muons like other hadrons, assuming that high $P_t$ muons could be identified and corrected for. For this study we retained only the stable daughter particles in $Z^0$ decay, labelled according to their parton parentage ("Jet 1 or 2"). We ignored the particles from the underlying event and from other final state jets. (These contributions, along with other non-$Z^0$ "noise", can be explicitly added back for relevant studies.) Finally, we note that the $Z^0$ decay angular distribution is approximately flat for these events, not peaked at 90 deg. as in Higgs $\rightarrow Z^0Z^0$; this will have little effect on our conclusions. To avoid very asymmetric decays, we required each of the two jets to satisfy $P_t > 100$ GeV/c.

**35190** (ANL-HEP-TR-91-78) **Effects of shower spreading on $Z^0 \rightarrow$ J J mass resolution.** Wicklund, A.B. Argonne National Lab., IL (United States). 4 Sep 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC-91-00083). Order Number DE92000296. Source: OSTI; NTIS; INIS; GPO Dep.

This study concerns the effects of hadronic shower spreading and lateral calorimeter segmentation on the jet-jet mass resolution, for high Pt (Pt>500 GeV) hadronic $Z^0$ decays. In a previous study, we examined the effects of lateral calorimeter segmentation on detection and measurement of high Pt $Z^0 \rightarrow$ jet-jet, for an ideal calorimeter with no lateral shower spreading. Other recent studies have also examined the dependence of $Z^0$ mass resolution on calorimeter segmentation, using more realistic models of shower spreading. The studies reported so far have assumed a common calorimeter segmentation for the EM and HAD compartments, and have concluded that (.05×.05) segmentation is a desirable optimization point, given the basic limitations imposed by calorimeter energy resolution, shower size, underlying event, etc. In the present study, we consider the case that HAD is segmented more coarsely, specifically (.1×.1) instead of (.05×.05), and we assume that the EM segmentation is fixed at (.05×.05), as driven by electron identification requirements. This "hybrid segmentation" would represent a significant cost saving for SDC. We might expect that the effects of coarser HAD segmentation on the jet- jet mass resolution would be minimal for two reasons. First, roughly half the jet energy is deposited in the EM compartment anyway, and benefits from the (.05×.05) EM cell size. Second, the lateral hadron shower size increases with depth, so that the shower spreading is larger on average in the HAD calorimeter alone, than it is in EM + HAD combined. Thus we might expect coarser segmentation to be less important deeper in the calorimeter.

**35191** (BNL-46214) **A search for the coherent production of axions in the milli eV range.** Cameron, R. (Rochester Univ., NY (United States)); Melissinos, A.C.; Semertzidis, Y.; Cantatore, G.; Rizzo, C.; Ruoso, P.; Zavattini, E.; Halama, H.; Lazarus, D.M.; Prodell, A.; Nezrick, F. Brookhaven National Lab., Upton, NY (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH00016 ;AC02-76ER03075. Grant PHYS-861 3003. (CONF-910881-16: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000439. Source: OSTI; NTIS; INIS; GPO Dep.

Axions provide a natural explanation for the absence of CP violation in the strong interaction. As weakly interacting light particles they are also candidates for the much sought after dark matter allegedly responsible for our lack of understanding of galactic dynamics. Beam dump, particle decay and astrophysical measurements carried out over the past decade have failed to provide positive evidence for their existence over a wide range of masses and coupling strengths. This experiment attempts to produce and detect scalar and pseudoscalar particles coherently produced through the interaction of laser photons with the virtual photons of the magnetic fields of superconducting dipole magnets as manifested by small changes in the polarization state of the laser light. A limit on the coupling of the axion to 2 photons of $g_{a\gamma\gamma} < 6.67 \times 10^{-7}$ GeV$^{-1}$ was achieved. 8 refs., 3 figs.

**35192** (BNL-46517) **Rare $K^+$ decays in flight: Latest results and future plans.** Alliegro, C. (Yale Univ., New Haven, CT (United States)); Zeller, M.E.; Campagnari, C.; Chaloupka, V.; Lubatti, H.J.; Zhao, T.; Cooper, P.S.; Egger, J.; Herold, W.D.; Kaspar, H.; Gordon, H.A.; Lazarus, D.M.; Rehak, R.; Hadley, N.J. Brookhaven National Lab., Upton, NY (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH00016 ;AC02-76ER03075. Grant PHY-8613003. (CONF-910881-13: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000484. Source: OSTI; NTIS; INIS; GPO Dep.

E777 at the Brookhaven AGS has published a final branching ratio limit for the lepton family violating decay $K^+ \rightarrow \pi^+\mu^+e^-$ of 2.1 × $10^{-10}$ (90% C.L.). New results based on approximately 500 events of the G.I. M. suppressed decay $K^+ \rightarrow \pi^+e^+e^-$ have yielded a branching ratio of (2.75 ± 0.23 ± 0.13) × $10^{-7}$ assuming a vector interaction with, a form factor = 0.105 ± 0.035 ± 0.015. The branching ratio times decay probability for $K^0 \rightarrow \pi^+ X^0$, $^0 \rightarrow e^+e^-$ was found to less than 1.5 × $10^{-8}$ (99% C.L.) in the $e^+e^-$ invariant mass range of 150 to 340 MeV/c. An approved second generation experiment sensitive to $K^+ \rightarrow \mu^+e^-$ at the $10^{-12}$ level is discussed. 5 refs., 3 figs.

**35193** (BNL-46546) **Particle production and spectra in E802 at BNL-AGS.** Videbaek, F. The E802 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9106274-1: Symposium on high energy nuclear collisions and quark gluon plasma, Kyoto (Japan), 6-8 Jun 1991). Order Number DE91018729. Source: OSTI; NTIS; INIS; GPO Dep.

The production of $\pi$, K, and protons measured in the E802 spectrometer are studied for p+A and Si+A collisions. Systematic properties of particle spectra and rapidity density distributions are discussed in terms of centrality and reaction system. A detailed comparison of the data to the RQMD model, which employs the experimental acceptance and cuts are presented. 8 refs., 6 figs.

**35194** (BNL-46555) **An experiment to observe strange particle production in ion collisions at the AGS.** Eisemen, S.E. (Brookhaven National Lab., Upton, NY (United States)); Etkin, A.; Foley, K.J.; Hackenburg, R.W.; Longacre, R.S.; Love, W.A.; Morris, T.W.; Platner, E.D.; Saulys, A.C.; Lindenbaum, S.R.; Chan, C.S.; Kramer, M.A.; Zhao, K.; Hallman, T.J.; MadanBrookhaven National Lab., Upton, NY (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;AC02-83ER40107 ;AS05-81ER40032 ;AC02-76ER03274. (CONF-9106274-2: Symposium on high energy nuclear collisions and quark gluon plasma, Kyoto (Japan), 6-8 Jun 1991). Order Number DE92000135. Source: OSTI; NTIS; INIS; GPO Dep.

We present the results of a measurement of neutral vee production with 14.6 × A GeV/c Si beams on Au and Cu targets. The $\Lambda$ and $K_s^0$ yields were measured as a function of negative particle multiplicity. Effective temperatures were determined from an exponential fit to the transverse mass distribution. 6 refs., 8 figs., 1 tab.

**35195** (BNL-46579) **B-Physics.** Soni, A. Brookhaven National Lab., Upton, NY (United States). [1991]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9101105-2: Workshop on high energy physics phenomenology, Calcutta (India), Jan 1991). Order Number DE92000477. Source: OSTI; NTIS; INIS; GPO Dep.

Rare B decays, measurement of CKM angles, Zweig rule violating decays of the $\gamma$(4S) and CP and violation are briefly discussed. After a brief overview I cover the following topics: rare i.e. Loop Decays; determination of KM angles; Zweig-rule violating decays of the $\gamma$(4S); CP violation; and outlook.

**35196** (DESY-91-051) **Measurement of the direct photon spectrum from Υ(1S) decays.** Bizzeti, A. (Istituto Nazionale di Fisica Nucleare, Florence (Italy)); Cartacci, A.; Compagnucci, A.; Conforto, G.; Landi, G.; Monteleoni, B.; Pelfer, P.G.; Schuette, J.; Folger, G.; Glaser, G.; Kobel, M.; Lurz, B.; Volland, U.; Wegener, H.; Antreasyan, D.Crystal Ball Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 15p. Contract DE-AC02-76ER03066;BMFT

054ER12P;BMFT 054HH11P(7);DE-AC0 (SLAC-PUB–5400). Order Number DE92714438. Source: OSTI; NTIS (US Sales Only); INIS.

Using the Crystal Ball detector at the $e^+e^-$ storage ring DORIS II, we have measured the energy spectrum of direct photons from $\Upsilon$(1S) decays. According to QCD, these photons result from the decays for the $\Upsilon$(1S) resonance into one photon and two gluons, $\Upsilon(1S)\rightarrow\gamma gg\rightarrow\gamma+$hadrons. The shape of our spectrum does not agree with that calculated in lowest order QCD, but can be described well by a prediction incorporating gluon self-interaction. Using this fit, the ratio $R_\gamma=\Gamma(\Upsilon\rightarrow\gamma gg)/\Gamma(\Upsilon\rightarrow ggg)$ is determined to be $(2.7\pm0.2\pm0.4)\%$. From this ratio we deduce the strong coupling constant in the anti Manti S scheme at $Q^2$=2.2 GeV$^2$ and find $\alpha_s=0.25\pm0.02\pm0.04$. (orig.).

**35197** (DESY–91-055) **Observations of $\Lambda_c^+$ semileptonic decay.** Albrecht, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Ehrlichmann, H.; Hamacher, T.; Krueger, A.; Nau, A.; Nippe, A.; Reidenbach, M.; Schaefer, M.; Schroeder, H.; Schulz, H.D.; Sefkow, F.; Wurth, R.; Appuhn, R.D.; Hast, C.; HerreARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 14p. Contract BMFT 054DO51P;BMFT 054ER12P;BMFT 055HD21P;BMFT 054KA17P Order Number DE92714436. Source: OSTI; NTIS (US Sales Only); INIS.

Direct observations of the semileptonic decay of $\Lambda_c^+$ in the decay channels $\Lambda_c^+\rightarrow\Lambda e^+X$ and $\Lambda_c^+\rightarrow\Lambda\mu^+X$ have been made using the ARGUS detector at the DORIS II $e^+e^-$ storage ring. The cross section times branching ratio were found to be, $\sigma(e^+e^-\rightarrow\Lambda_c^+X).BR(\Lambda_c^+\rightarrow\Lambda e^+X)=4.20\pm1.28\pm0.71$ pb and $\sigma(e^+e^-\rightarrow\Lambda_c^+X).BR(\Lambda_c^+\rightarrow\Lambda\mu^+X)=3.91\pm2.02\pm0.90$ pb. (orig.).

**35198** (DESY–91-056) **A measurement of $\tau(B^+)/\tau(B^0)$ from the lepton and dilepton rates in $\Upsilon$(4S) decays.** Albrecht, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Ehrlichmann, H.; Hamacher, T.; Krueger, A.; Nau, A.; Nippe, A.; Reidenbach, M.; Schaefer, M.; Schroeder, H.; Schulz, H.D.; Sefkow, F.; Wurth, R.; Appuhn, R.D.; Hast, C.; HerreARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 10p. Contract BMFT 054DO51P;BMFT 054ER12P;BMFT 054HD24P;BMFT 054KA17P Order Number DE92714439. Source: OSTI; NTIS (US Sales Only); INIS.

Using the ARGUS detector at the $e^+e^-$ storage ring DORIS II, we have determined the lepton and dilepton rates in $\Upsilon$(4S) decays. From this measurement we derive the lifetime ratio of charged and neutral B mesons and obtain $\tau(B^+)/\tau(B^0)=1.00^{+0.49}_{-0.32}$. (orig.).

**35199** (DOE/ER/02504–656) **High energy accelerator and colliding beam user group: Progress report, March 1, 1991–February 29, 199.** Snow, G.A.; Skuja, A. Maryland Univ., College Park, MD (United States). Dept. of Physics and Astronomy. Aug 1991. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76ER02504. This report discusses work in the following areas: The Study of $e^+e^-$ Interactions; Calculation of Radiative Polarization Effects in Electron Storage Rings; Hadron Collider Physics; Fixed Target Physics and Particle Physics of General Interest; and The Solenoidal Dectector Collaboration at the SSCL.

**35200** (FNAL/C–91/216) **Measurement of $\bar{p}p$ elastic scattering parameters at $\sqrt{s}$ = 1.8 TeV.** Shukla, S. E710 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9105241–2: 4. international conference on elastic and diffractive scattering, Isola D'Elba (Italy), 22-25 May 1991). Order Number DE91018960. Source: OSTI; NTIS; INIS; GPO Dep.

A measurement of the total nuclear cross section, $\sigma_t$, the ratio of the real to the imaginary part of the forward nuclear elastic scattering amplitude, $\rho$, and the nuclear slope parameter, B, for $\bar{p}p$ elastic scattering at $\sqrt{S}$ = 1.8 Te V, is presented. We find $\sigma_t$ = 72.8 $\pm$ 3.1 mb, $\rho$ = 0.140 $\pm$ 0.69 and B = 16.99 $\pm$.47 (GeV/c)$^{-2}$. 5 refs., 13 figs., 2 tabs.

**35201** (FNAL/C–91/223-E) **Results from $\bar{p}p$ colliders.** Huth, J. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910881–7: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000156. Source: OSTI; NTIS; INIS; GPO Dep.

Recent results $\bar{p}p$ colliders are presented. From elastic scattering experiments at the Tevatron, an average value of $\sigma_{tot}$ = 72.1$\pm$2 mb is reported, along with a new measurement of $\rho$ = 0.13 $\pm$ 0.7. New measurements of jet direct photon and high $p_t$ W and Z production are compared to more precise, higher order predictions from perturbative QCD. Recently available data on the W mass and width give combined values for $M_W$ = 80.14$\pm$0.27 GeV/c$^2$, and $\Gamma$(W) =2. 14 $\pm$ 0.08 GeV. From electroweak radiative corrections and $M_W$, one finds $M_{top}$ = 130$\pm$40 GeV/c$^2$, with a 95% C.L. upper limit at 210 GeV/c$^2$. Current limits on $M_{top}$ are presented, along with a review of the prospects for top discovery. From jet data there is no evidence of quark substructure down to the distance scale of 1.4 $\times$ $10^{-17}$ cm, nor is there evidence for supersymmetry or heavy gauge bosons at $\bar{p}p$ colliders, allowing lower limits on $M_W$, > 520 GeV/c$^2$ and $M_Z$ 412 GeV/c$^2$. 66 refs., 26 figs.

**35202** (FNAL/C–91/227) **Measurement of $\rho$, the ratio of the real to imaginary part of the $\bar{p}p$ forward elastic scattering amplitude, at $\sqrt{s}$ = 1.8 TeV.** Rubinstein, R. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 3p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); North Atlantic Treaty Organization, Brussels (Belgium); Ministry of Public Instruction (Italy). DOE Contract AC02-76CH03000. (CONF-910881–9: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000155. Source: OSTI; NTIS; INIS; GPO Dep.

We have measured $\rho$, the ratio of the real to the imaginary part of $\bar{p}p$ forward elastic scattering amplitude, at $\sqrt{s}$ = 1.8 TeV. Our result, $\rho$ = 0.140 $\pm$ 0.069, is consistent with the expected value, and thus no new physics is required. 10 refs., 2 figs.

**35203** (FNAL/C–91/234-E) **Search for new particles in CDF.** Laasanen, A. (Purdue Univ., Lafayette, IN (United States). Dept. of Physics). The CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910881–17: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000638. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results on searches for new particles beyond the Standard Model are presented. The data were taken by the CDF collaboration at the Fermilab $\bar{p}p$ collider at a center of mass energy of 1.8 TeV. Limits on the masses of the gluino and squark in a minimal supersymmetric theory are given. The 90% confidence level asymptotic lower mass limits on each are 150 GeV/c$^2$. A special data run was taken to search for the diffractively produced sextet quark state $\eta_6$. An $\eta_6$ with a mass larger than 20 GeV/c$^2$ is excluded at the 95% confidence level. Limits are also set on the pair-production of massive stable charged particles. Unit-charged particles belonging to spin $\frac{1}{2}$ color triplets with masses between 50 and 139 GeV/c$^2$ are ruled out at the 95% confidence level as are charge 2/3 particles with masses between 50 and 116 GeV/c$^2$ and charge 4/3 particles with masses between 50 and 140 GeV/c$^2$. 5 refs., 3 figs.

**35204** (FNAL/C–91/236-E) **Isolated single and double direct photon production at CDF.** Harris, R. The CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910881–15: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000471. Source: OSTI; NTIS; INIS; GPO Dep.

We present measurements of isolated direct phonon production in $\bar{p}p$ collisions at $\sqrt{s}$ = 1.18 TeV from the 1988–89 run of the Collider Detection at Fermilab (CDF). Quantum Chromodynamics is tested against measurements of the transverse momentum spectrum of single photon production ($\bar{p}p\rightarrow\gamma+X$), double photon production ($\bar{p}p\rightarrow\gamma\gamma+X$), and the distribution of cos$\theta^*$ in photon-jet events ($\bar{p}p\rightarrow\gamma_J+X$). We also present a measurement of the isolated production ratio of $\eta$ and $\pi^0$ mesons ($\bar{p}p\rightarrow\eta+X$)/($\bar{p}p\rightarrow\pi^0+X$) = 1.02 $\pm$.15(stat)$\pm$.23(sys). 9 refs., 2 figs.

**35205** (FNAL/C–91/237-E) **Measurement of $B^0\bar{B}^0$ mixing at CDF.** Song, L. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910881–18: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000640. Source: OSTI; NTIS; INIS; GPO Dep.

Using dileptons ($e\mu$, ee) to tag B hadron decays, the average $B^0\bar{B}^0$ mixing parameter $\chi$ is measured in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV. From $e\mu$ channel, we obtain $\chi$ = 0.179 ± 0.027 (stat) ± 0.022 (sys) ± 0.032 (model), and from the ee channel, $\chi$ = 0.172 ± 0.060 (stat) ± 0.024 (sys) ± 0.026 (model), where the last uncertainty is due to Monte Carlo modeling. 14 refs., 2 tabs.

**35206** (FNAL/C–91/238-E) **T,b, and new particle searches at $p\bar{p}$ colliders.** Crane, D.A. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9106285–1: 11. international conference on physics in collision, Colmar (France), 20-22 Jun 1991). Order Number DE92000637. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments at the $p\bar{p}$ colliders at CERN and FNAL have an active program of heavy flavor physics. Recently, CDF at FNAL and UA1 at CERN have measured rare decays of the $B^0 - \bar{B}^0$ mixing. CDF has signals for $B^{\pm} \rightarrow J/\psi K^{\pm}$ and $B^0 \rightarrow J/\psi K^{*0}$. Both CDF and UA1 have set limits on the branching ratio of $B^0 \rightarrow \mu^+\mu^-$ and have measured $B^0 - \bar{B}^0$ mixing. CDF, UA1 and UA2 at CERN have searched for the top quark and set limits on its mass. Prospects for t and b physics at FNAL in the near future are presented. 21 refs., 14 figs.

**35207** (KEK–90-22) **Proceedings of the 15th workshop on the mass of the electron neutrino.** Yasumi, Shinjiro (ed.) (Teikyo Univ., Tokyo (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Mar 1991. 43p. (In Japanese). (CONF-9101112–: 15. workshop on the mass of the electron neutrino, Tsukuba (Japan), 10 Jan 1991). Order Number DE92704307. Source: OSTI; NTIS (US Sales Only); INIS.

This booklet carries eight talks and three appendices presented at the 15th workshop on the mass of the electron neutrino held on January 10, 1991, at National Laboratory for High Energy Physics (or KEK), Japan. The workshop focuses on recent studies on $m\nu_e$, studies and comments on 5p-3s line of Dy atom, measurement of the number of incident photons in $m\nu_e$-PF experiments, measurement of absorption cross section of Dy atom for soft X-ray, evaluation of $\sigma_i{}^{\alpha}$ of Dy atom, $\lambda_N/\lambda_M$ experiments (synthesis of $Ho(fod)_3$, measurement with heated proportional counter), and monochromator for soft X-ray in the range of 1.0-1.6 keV. In particular, discussions for $m\nu_e$-PF experiments are made focusing on the development of a high-performance monochromator for soft X-ray in the range of 1.0-1.6 keV for measuring the fluorescent X-ray spectra of $S_{Ed}$, $S_{Ee}$ and $S_{Ef}$. It is still nuclear whether the deterioration in a beryl crystal monochromator is associated with temperature changes or radiation damage, but cooling equipment for tests under decreasing temperature is now being constructed at KEK. Performance tests of a heated proportional counter for non-active $Ho(fod)_3$ and the production of active $Ho(fod)_3$ are also planned to be conducted. (N.K.).

**35208** (LA-UR–91-2891) **Strangeness production at 200 GeV/Nucleon.** Jacak, B.V. For the HELIOS collaboration. Los Alamos National Lab., NM (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9106274–3: Symposium on high energy nuclear collisions and quark gluon plasma, Kyoto (Japan), 6-8 Jun 1991). Order Number DE92000259. Source: OSTI; NTIS; INIS; GPO Dep.

Results from the HELIOS External Spectrometer on kaon production in 200 GeV/A S+W and p+W collisions are presented. The $K/\pi$ ratios are compared with measurements at lower bombarding energies and are found to agree remarkably well. Evidence for secondary production of $K^+$ by meson-baryon rescattering is reviewed. The target rapidity results are compared with neutral strange particle results at midrapidity. 15 refs., 4 figs., 2 tabs.

**35209** (LA-UR–91-3136) **Direct measurements of neutrino mass: A status report.** Robertson, R.G.H. Los Alamos National Lab., NM (United States). [1991]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9103166–5: 2. international symposium on particles, strings and cosmology, Boston, MA (United States), 25-30 Mar 1991). Order Number DE92000168. Source: OSTI; NTIS; INIS; GPO Dep.

Some recent developments in the experimental search for neutrino mass are discussed. New data from Los Alamos on the electron neutrino mass as measured in tritium beta decay give an upper limit of 9.3 eV at the 95% confidence level. This result is not consistent with the long-standing ITEP result of 26(5) eV within a "model-independent" range of 17 to 40 eV. It now appears that the electron neutrino is not sufficiently massive to close the universe by itself. Hime and Jelley report finding new evidence for a 17-keV neutrino in the B decay of $^{35}S$ and $^{63}Ni$. Many other experiments are being reported and the situation is still unresolved. 56 refs., 1 fig., 3 tabs.

**35210** (LBL–30734) **Meson and baryon correlation studies using the PEP-TPC/2$\gamma$ Facility.** Ronan, M.T. Lawrence Berkeley Lab., CA (United States). Mar 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9103200–2: 26. Rencontres de Moriond conference, Les Arcs (France), 10-24 Mar 1991). Order Number DE92000853. Source: OSTI; NTIS; INIS; GPO Dep.

Results on vector meson, and strange and charmed-baryon production are presented for data taken during the period 1982–1986 using the TPC/2$\gamma$ detector at PEP. Vector mesons ($\rho^0$, $K^*$ and $\phi$) with 0, 1 and 2 strange quarks are used to obtain redundant measures of strange-quark suppression and of the vector to pseudoscalar ratio in hadronization. Measurements of the production rates of $\Lambda$, $\Xi^-$, $\Omega$ and $\Xi^{*0}$ hyperons and for the $\Lambda_c$ and of rapidity correlations between $\Lambda\bar{\Lambda}$ pairs provide sensitive tests of baryon production in fragmentation models. In addition, two- and three-particle correlations between like sign pions provide further evidence for the Bose-Einstein effect in $e^+e^-$ interactions including the relativistic motion of particle sources. 9 refs., 7 figs.

**35211** (LBL–30849) **Mini-jet and particle production in ultra-relativistic heavy ion collisions.** Wang, Xin-Nian. Lawrence Berkeley Lab., CA (United States). Jul 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9105106–29: Conference on the intersections between particle and nuclear physics, Tucson, AZ (United States), 23-29 May 1991). Order Number DE92000856. Source: OSTI; NTIS; INIS; GPO Dep.

Mini-jet and particle production are studied in the framework of HIJING Monte Carlo model which can describe pp and $p\bar{p}$ collisions well from ISR to Fermilab Tevatron energies. Mini-jets are shown to have eminent contributions to particle production in ultra-relativistic heavy ion collisions. However, parton shadowing and jet quenching also have important effects and can be studied by single particle distributions. 19 refs., 5 figs.

**35212** (LBL–31040) **Update to the RHIC Letter of Intent for an experiment on particle and jet production at midrapidity.** The STAR Collaboration. Lawrence Berkeley Lab., CA (United States). Jul 1991. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000724. Source: OSTI; NTIS; INIS; GPO Dep.

This document is an Update to the Letter of Intent (LOI) submitted by this collaboration in September 1990 proposing a large acceptance solenoidal tracking experiment. Since that time the collaboration has chosen the name STAR, representing Solenoidal Tracker At RHIC. The physics interests of the STAR collaboration and the goals of the experiment are described in the original LOI. Since submission of the LOI, several changes have been made in the design of the experiment motivated by the desire to expand pseudorapidity coverage for complete event characterization and by the necessity to achieve cost reduction. The major changes are: Expansion of pseudorapidity coverage to $|\eta| < 4.5$ by the addition of tracking chambers external to the magnet; reduction in the number of time-of-flight channels from 100K to 10K; staging implementation of hadronic calorimetry while using tracking and electromagnetic calorimetry to extract parton physics in the initial configuration; reduction in the cost per channel of Time Projection Chamber (TPC) electronics through continued TPC electronics

R&D supported from RHIC funds; and a change in the Silicon Vertex Tracker (SVT) technique to the use of silicon drift chambers. These changes and the status of ongoing R&D programs to optimize the design and performance of the STAR experiment will be presented. In terms of detector performance it will be demonstrated that the space charge loading of the TPC is negligible and that the STAR experiment can operate at the highest RHIC luminosities. A summary of the detector systems is presented in this paper.

**35213** (SLAC–381) **A measurement of the branching ratio of the Z boson to bottom quarks using precision tracking.** Jacobsen, R.G. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jul 1991. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. Order Number DE91019004. Source: OSTI; NTIS; INIS; GPO Dep.

We use the precision vertex detectors installed in the Mark 2 detector to measure $R_b$, the fraction of $Z^0$ bosons decays into hadrons that include bottom quarks. The $Z^0$ bosons were created via $e^+e^-$ annihilation at 91 GeV by the Stanford Linear Collider during the 1990 running. The Mark 2 tracking system, including the Silicon Strip Vertex Detector and Drift Chamber Vertex Detector, achieves a track position resolution of better than 20 microns for high momentum tracks at the collision point. We describe procedures used to obtain this resolution, including alignment of the Silicon Strip Vertex Detector, and techniques used to quantify the achieved resolution. We can, for the first time, measure the impact parameters of tracks accurately enough to use the finite b quark lifetime to tag a sample of events containing b quarks. This is done by requiring events which contain at least three tracks with impact parameter greater than three times the calculated impact parameter error. The b quark tagging efficiency is 48% and 85% of the tagged sample events contain b quarks. Using the 29 events tagged out of a total of 220 identified hadronic $Z^0$ decays, we measure $R_b \equiv Br(Z^0 \rightarrow b\bar{b})/Br(Z^0 \rightarrow hadrons) = 0.230 \pm 0.048 \pm 0.030$ where the first error is statistical and the second is systematic. This value of $R_b$ is in good agreement with existing measurements made using other methods and the Standard Model prediction of 0.22 using a $\sin^2\theta_W$ value of 0.225.

**35214** (SLAC-PUB–4977) **Measuring the mass and width of the $Z^0$: The status of the energy spectrometers.** Rouse, F. (Lawrence Berkeley Lab., CA (United States)); Levi, M.; Kent, J.; King, M.; Von Zanthier, C.; Watson, S.; Bambade, P.; Erickson, R.; Jung, C.K.; Nash, J.; Wormser, G. Lawrence Berkeley Lab., CA (United States). May 1989. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AC03-76SF00098 ;AM03-76SF00010. (LBL–27160;CONF-8902110–6: 2. international symposium on the fourth family of quarks and leptons, Santa Monica, CA (United States), 23-25 Feb 1989). Order Number DE92000939. Source: OSTI; NTIS; INIS; GPO Dep.

The Stanford Linear Collider (SLC) located at the Stanford Linear Accelerator Center (SLAC) collides electrons and positrons produced in the linear accelerator pulse by pulse. The object is to produce collisions energetic enough to produce the heavy intermediate vector boson, the $Z^0$. An essential component of the SLC physics program is the precise knowledge of the center-of-mass energy of each interaction. We measure the energy of each collision by using two energy spectrometers. The spectrometers are located in extraction lines of each beam. We will measure the energy of each beam to 20 MeV or 5 parts in $10^4$. We report here on the status of the energy spectrometer system. 13 refs., 7 figs., 3 tabs.

**35215** (SLAC-PUB–5600) **A search for the production of the final states $\tau^+\tau^-e^+e^-$, $\tau^+\tau^-\mu^+\mu^-$, and $\tau^+\tau^-\pi^+\pi^-$ in $e^+e^-$ collisions at $\sqrt{s}$ = 29 GeV.** The Mark II (at PEP) Collaboration. Stanford Linear Accelerator Center, Menlo Park, CA (United States); Lawrence Berkeley Lab., CA (United States); Harvard Univ., Cambridge, MA (United States). Dept. of Physics. Jul 1991. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (LBL–31178;CONF-9107172–1: 15. joint international lepton photon symposium at high energies and European Physical Society (EPS) conference on high energy, Geneva (Switzerland), 25 Jul - 1 aug 1991). Order Number DE91018884. Source: OSTI; NTIS; INIS; GPO Dep.

We have searched for the reaction $e^+e^- \rightarrow \tau^+\tau^-f\bar{f}$, where f is either an electron, muon, or charged pion, at $\sqrt{s}$ = 29 GeV using the Mark 2 detector at the PEP storage ring. One candidate event is found while 2.3 events are expected from known processes. We would expect to see 11 events if the cross-section for $e^+e^- \rightarrow \tau^+\tau^-f\bar{f}$ at $\sqrt{s}$ = 29 GeV were enhanced by the factor of 4.7 which the ALEPH collaboration reports for $\sqrt{s}$ = 91 GeV. we also look for $e^+e^- \rightarrow e^+e^-f\bar{f}$ and $e^+e^- \rightarrow \mu^+\mu^-f\bar{f}$, and for $e^+e^- \rightarrow \tau^+\tau^-\gamma$ using a similar analysis procedure and see the number of events predicted by the standard model. 10 refs., 5 figs., 3 tabs.

**35216** (SLAC-PUB–5619) **Constraints placed on the Higgs sector from precision electroweak measurements.** Takeuchi, Tatsu. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9104299–1: 1991 Nagoya spring school on dynamical symmetry breaking, Nakatsugawa, Gifu-ken (Japan), 23-27 Apr 1991). Order Number DE92000236. Source: OSTI; NTIS; INIS; GPO Dep.

In this lecture, I would like to investigate what precision electroweak measurements have to tell us about the Higgs sector. I will show that the radiative corrections to electroweak interaction observables coming from the Higgs sector can be summarized into three parameters S, T, and U. The precision measurements of the observables will constrain S and T. By comparing these constraints with the theoretically predicted values of S and T, we will be able to tell which Higgs sector theories are more viable than others. 24 refs., 3 figs.

**35217** (DESY–91-035) **Constraints of dynamical symmetry breaking mechanisms from electroweak data.** Ali, A.; Degrassi, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Apr 1991. 19p. Order Number DE92714309. Source: OSTI; NTIS (US Sales Only); INIS.

Consistency of the Salam-Weinberg theory, including quantum corrections, with high precision data from LEP and elsewhere imposes non-trivial bounds on the parameters of this theory, in particular the top quark mass. We take stock of the available experimental information in the electroweak sector with the view of constraining possible additional interactions, such as present in dynamical symmetry breaking scenarios. Using the Peskin-Takeuchi isospin conserving, S and -violating, T, parametrization of new physics contribution to vacuum polarization corrections, we show here that the full one family technicolor models are ruled out at the 95% C.L. from the LEP data and $m_W$-measurements alone. We stress the role of improved precision measurements of the W-boson mass and the decay width $\Gamma(Z \rightarrow b\text{anti } b)$ in the enhanced sensitivity gained on such interactions. (orig.).

**35218** (DESY–91-039) **Associate production of a heavy quark and a gauge boson at $e^{\pm}p$ colliders.** Drees, M. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.). Gruppe Theorie); Kim, C.S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Apr 1991. 28p. (DTP–91/16). Order Number DE92714305. Source: OSTI; NTIS (US Sales Only); INIS.

We study the reaction $e+p \rightarrow e+Q+V+X$, where Q stands for a c or b quark and $V=\gamma$, W or Z. At HERA only the combination Q=c, $V=\gamma$ seems promising; it should allow to measure the c quark density inside both the proton and the photon. Here, c quarks are identified through their muonic decays. At LEPxLHC, $\gamma$+b(anti b) and $W^{\pm}$+c(anti c) production also have sizeable rates; The first reaction might allow to measure the b content of the photon, while the second reaction can determine the strange-sea and the valence d-quark distributions in the proton, and might provide a statistically independent measurement of the WW$\gamma$ vertex. (orig.).

35219 (DESY–91-041) **Asymptotic solutions of the evolution equation for the polarized nucleon structure function $g_2(x,Q^2)$.** Ali, A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Braun, V.M.: Hiller, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 15p. (HD-THEP–91-09). Order Number DE92714430. Source: OSTI; NTIS (US Sales Only); INIS.

We show that quark operators of twist 3 contributing to the polarized nucleon structure function $g_2^{tw.3}(x, Q^2)$ decouple from the evolution equation for the quark-gluon operators of the same twist in two important limits, $N_c \to \infty$ and $n \to \infty$ ($N_c$ is the number of colours and n refers to the n-th moment of $g_2$). The anomalous dimensions for the quark operators turn out to be always the lowest ones in the spectrum. Asymptotic behaviour of $g_2(x, Q^2)$ in the region $1-x << 1$ is derived. Results of an extensive numerical study of the spectrum of anomalous dimensions for QCD and for the $N_c \to \infty$ cases are presented. (orig.).

35220 (DESY–91-045) **A practical introduction to electroweak radiative corrections.** Drees, M. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.). Gruppe Theorie). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 27p. Order Number DE92714433. Source: OSTI; NTIS (US Sales Only); INIS.

This is a brief introduction into electroweak radiative corrections within the Standard Model, with the emphasis on performing actual calculations. To this end, a complete set of expressions is given that allows the computation of the $\rho$ parameter, the W mass, and Z→fanti f decays for massless fermions, where the anti Manti S scheme has been used. I conclude with an assessment of what we have learned so far from electroweak precision experiments, and a brief outlook. (orig.).

35221 (DESY–91-050) **On the possibility of resonances in longitudinally polarized vector boson scattering.** Veltman, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Veltman, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 29p. Order Number DE92714432. Source: OSTI; NTIS (US Sales Only); INIS.

Assuming that no Higgs has been found below 1 TeV, we study the physics of longitudinally polarized vector boson ($W_L$) scattering in the TeV region, using a one loop calculation and partial wave analysis. We show that the occurence of a resonance in the isospin I=1 channel depends on a certain parameter called $\beta$, which is measured near threshold. We investigate the similarity between low energy $\pi\pi$ scattering and high energy $W_LW_L$ scattering, as suggested by the equivalence theorem. (orig.).

35222 (DESY–91-053) **Neutrino masses, neutral vector bosons and the scale of B-L breaking.** Buchmueller, W. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Greub, C.; Minkowski, P. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 9p. Order Number DE92714435. Source: OSTI; NTIS (US Sales Only); INIS.

Extensions of the standard model with extra neutral vector bosons predict additional fermions whose allowed masses are constrained by the masses of the new vector bosons. For the minimal case with one extra Z' boson and an extended gauge group contained in the unified group SO(10), we derive upper and lower bounds on the masses of heavy Majorana neutrinos. We also discuss implications for the standard model Higgs boson. (orig.).

35223 (DESY–91-054) **Heavy quark production in panti p interaction at collider energies.** Levin, E.M. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)); Ryskin, M.G.; Shabelski, Yu.M.; Shuvaev, A.G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 10p. Order Number DE92714441. Source: OSTI; NTIS (US Sales Only); INIS.

Here we compare the new data on b-quark production with prediction of the naive parton model and semihard approach, based on perturbative QCD. We claim that semihard approach gives the good description of CDF data on beauty production, so we have now in hands the parametrization of gluon structure function that allows us to predict heavy quark production at higher (LHC and SSC) energies. (orig.).

35224 (DESY–91-058) **On semileptonic B decays into longitudinally polarized $\rho$ mesons.** Manakos, P. (Technische Hochschule Darmstadt (Germany, F.R.)); Mannel, T. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 11p. Order Number DE92714443. Source: OSTI; NTIS (US Sales Only); INIS.

The heavy quark limit can not be taken directly for the decay $B \to \rho e\nu$ if the $\rho$ meson is longitudinally polarized. We employ some recent ideas of a special realization of chiral symmetry to relate the above process to the decay $B \to \pi e\nu$ in the heavy quark limit, which corresponds to the chiral limit in this so called vector realization of chiral symmetry. (orig.).

35225 (DESY–91-059) **Renormalization scheme dependence and infrared behaviour in $e^+e^-$ annihilations and $\tau$-lepton decay at the next-to-next-to-leading order of perturbative QCD.** Chyla, J. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Fyzikalni Ustav); Kataev, A.; Larin, S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 21p. Order Number DE92714429. Source: OSTI; NTIS (US Sales Only); INIS.

We present a detailed investigation of the renormalization scheme dependence of the next-to-next-leading order QCD predictions for the processes $e^+e^- \to$hadrons and $\tau \to \nu_\tau +$hadrons. The comparison of the results obtained in three frequently used approaches to resolving the renormalization scheme ambiguities with experimental data is carried out and special features of the approximants in the infrared and ultraviolet regions are analysed. (orig.).

35226 (DESY–91-061) **Bounds on the top mass from Z decays into b quarks.** Djouadi, A. (Technische Hochschule Aachen (Germany, F.R.). Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 9p. (CONF-9103200–: 26. Rencontres de Moriond conference, Les Arcs (France), 10-24 Mar 1991). Order Number DE92714444. Source: OSTI; NTIS (US Sales Only); INIS.

I discuss the information that can be obtained on the top quark mass from high-precision measurements in the decay $Z \to b\bar{b}$ which are performed at LEP. I will show that there are two completely independent ways to constrain this parameter: While the forward-backward asymmetry $A_{FB}{}^b$ directly measures the top effect stemming from gauge boson self-energies and which affect all electroweak observables, the ratio of decay widths $\Gamma_b = \Gamma(Z \to b\bar{b})/\Gamma(Z \to \text{hadrons})$ is only sensitive to the top effect due to vertex corrections. Non genuine electroweak effects on the two observables as well as possible effects due to New Physics are also discussed. (orig.).

35227 (FNAL/C–91/200) **Hyperons: Insights into baryon structures.** Lach, J. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-901283–2: 4. Mexican school on particles and fields, Oaxtepec (Mexico), 3-14 Dec 1990). Order Number DE91018890. Source: OSTI; NTIS; INIS; GPO Dep.

The baryon octet is composed mainly of hyperons. Modern high energy hyperon beams provide a tool for the study of hyperon static properties and interactions. Experiments with these beams have provided new insights into hyperon rare decays, magnetic moments, and interactions. These experiments provide us with insights into the strong, weak, and electromagnetic structure of the baryons. 65 refs., 45 figs., 5 tabs.

35228 (FNAL/C–91/225) **Jet rates from deep inelastic muon scattering in the W range of 15 to 35 GeV.** Salgado, C. E665 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-910881–14: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000470. Source: OSTI; NTIS; INIS; GPO Dep.

Production rates of forward jets in deep inelastic muon scattering are studied using the JADE jet finding algorithm. The evolution of di-jet rates with W is compared to QCD first order predictions in the W range of 15 to 25 GeV. 7 refs., 3 figs.

**35229** (LA-UR–91-3038) **Muonium to antimuonium conversion and the decay $\mu^+ \rightarrow e^+ \nu_e \nu_\mu$ in left-right symmetric models.** Herczeg, P. (Los Alamos National Lab., NM (United States)); Mohapatra, R.N. Los Alamos National Lab., NM (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910881–10: Particles and fields '91, Vancouver (Canada), 18-22 Aug 1991). Order Number DE92000195. Source: OSTI; NTIS; INIS; GPO Dep.

We investigate muonium to antimuonium conversion and the exotic muon decay $\mu^+ \rightarrow e^+ \bar{\nu}_e \epsilon_\mu$ in $SU(2)_L \times SU(2)_R \times U(1)_{B-L}$ models. 7 refs.

**35230** (ORNL/CCIP–91/25) **A Monte Carlo study of the light $q^2\bar{q}^2$ system.** Grondin, G. (Toronto Univ., ON (Canada). Dept. of Physics). Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States); Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada); Tennessee State Government, Nashville, TN (United States); Stevens (E.C.) Fellowship (United States). DOE Contract AC05-84OR21400 ;AS05-76ER03956. Contract R01-1062-32. We present results from a Guided Random Walk Monte Carlo simulation of the light (q = u, d) $q^2\bar{q}^2$ system in a Coulomb-plus-linear quark potential model using an Intel iPSC/860 hypercube. We find evidence for no bound states below the vector-vector threshold in the (J,I) = (2,2) and (2,0) sector. 14 refs., 2 figs.

## 6453 Particle Invariance Principles and Symmetries

**35231** (DESY–91-037) **Quasi Hopf quantum symmetry in quantum theory.** Mack, G. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik); Schomerus, V. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 39p. Order Number DE92714304. Source: OSTI; NTIS (US Sales Only); INIS.

In quantum theory, internal symmetries more general than groups are possible. We show that quasitriangular quasi Hopf algebras $G^*$ as introduced by Drinfeld permit a consistent formulation of a transformation law of states in the physical Hilbert space H, of invariance of the ground state, and of a transformation law of field operators which is consistent with local braid relations of field operators as proposed by Froehlich. All this remains true when Drinfelds axioms are suitably weakened in order to build in truncated tensor products. Conversely, all the axioms of a weak quasitriangular quasi Hopf algebra are motivated from what physics demands of a symmetry. Unitarity requires in addition that $G^*$ admits a*-operation with certain properties. Invariance properties of Greens functions follow from invariance of the ground state and covariance of field operators as usual. Covariant adjoints and covariant products of field operators can be defined. The R-matrix elements in the local braid relations are in general operators in H. They are determined by the symmetry up to a phase factor. Quantum group algebras like $U_q(sl_2)$ with vertical strokeqvertical stroke=1 are examples of symmetries with special properties. We show that a weak quasitriangular quasi Hopf algebra $G^*$ is canonically associated with $U_q(sl_2)$ if $q^P$=-1. We argue that these weak quasi Hopf algebras are the true symmetries of minimal conformal models. Their dual algebras G ('functions on the group') are neither commutative nor associative. (orig.).

**35232** (INIS-BR–2702, pp. 3-16) **Chiral symmetry: breaking and restoration in the nucleus.** Krein, G. (Santa Maria Univ., RS (Brazil). Dept. de Fisica). Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1990. 382p. (In Portuguese). (CONF-9009301–: 13. Workshop on Nuclear Physics in Brazil, Caxambu (Brazil), 2-6 Sep 1990). In *Proceedings of the 13. Workshop on Nuclear Physics in Brazil.* Order Number DE91643436. Source: OSTI; NTIS (US Sales Only); INIS.

The dynamical chiral symmetry breaking and its restoration in nucleus is studied. The chiral symmetry is discussed in the context of QCD. The Nambu-Jona-Lasinio model is presented as prototype model for carrying out the chiral symmetry in QCD and, to describe its restoration in function of the density of quarks. The consequences on Nuclear Physics of partial chiral symmetry restoration as function of the nuclear density are analysed. (M.C.K.).

**35233** (LA-UR–91-2926) **The riddle of high-energy baryon number violation.** Mattis, M.P. Los Alamos National Lab., NM (United States). Sep 1991. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92000253. Source: OSTI; NTIS; INIS; GPO Dep.

The exciting possibility that anomalous baryon and lepton number violation might be observable at the next generation of supercolliders is suggested by an instanton calculation due to Ringwald and Espinosa. In these Lectures, the current controversial status of these claims is discussed, and several new technologies designed to analyze this question are reviewed. These technologies should contribute more generally to our understanding of weakly- coupled field theories in the nonperturbative regime where both energies and multiplicities are very large. 61 refs., 35 figs.

**35234** (LA-UR–91-3063) **Physical interpretation of supercoherent states and their associated Grassmann numbers.** Nieto, M.M. Los Alamos National Lab., NM (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9105251–2: Meeting on the foundation of quantum mechanics, Santa Fe, NM (United States), 27-31 May 1991). Order Number DE92000187. Source: OSTI; NTIS; GPO Dep.

A physical interpretation of supercoherent states is suggested. It is based upon the observation that an ordinary coherent state is an eigenstate of a specific mode of the radiation field. A supercoherent state is viewed as a photino coherently combined with photons of the same mode. An interpretation of the associated Grassmann-valued numbers of the state is also discussed. 13 refs.

**35235** (DESY–91-040) **Color confinement, abelian dominance and the dynamics of magnetic monopoles in SU(3) gauge theory.** Brandstaeter, F. (Hoechstleistungsrechenzentrum (HLRZ), Juelich (Germany, F.R.). Gruppe Theorie der Elementarteilchen); Wiese, U.J.; Schierholz, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 18p. (HLRZ–91-37). Order Number DE92714306. Source: OSTI; NTIS (US Sales Only); INIS.

Extending earlier work, we investigate the vacuum structure of the pure SU(3) gauge theory in the maximally abelian gauge. In this gauge the long-distance physics is carried essentially by the abelian degrees of freedom. Monopoles show up as particle-like singularities in the gauge fixing procedure. We find evidence that these monopoles condense in the confined phase of the vacuum, in accord with the picture of a dual superconductor, whereas they are dilute and increasingly static as the temperature increases in the deconfined phase. (orig.).

**35236** (DESY–91-042) **WZW superconformal blocks from three dimensions.** McArthur, I.N. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 18p. Order Number DE92714311. Source: OSTI; NTIS (US Sales Only); INIS.

A three-dimensional theory whose canonical quantization yields wavefunctions which can be identified with the superconformal blocks of two-dimensional super-Wess-Zumino-Witten theory is presented. In particular, the anomalous Ward identities satisfied by the superconformal blocks in the presence of a supergauge background are reproduced in terms of constraints obeyed by the wavefunctions of the three-dimensional theory. The action contains the bosonic Chern-Simons action but does not possess a three-dimensional supersymmetry. The 'time' coordinate plays the role of an interpolating parameter between two-dimensional superconnections. The structure of the Hilbert space of the theory is examined. (orig.).

35237 (DESY–91-043) **Field operators for anyons and plektons.** Rehren, K.H. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 30p. Order Number DE92714431. Source: OSTI; NTIS (US Sales Only); INIS.

Given its superselection sectors with non-abelian braid group statistics, we extend the algebra A of local observables into an algebra F containing localized intertwiner fields which carry the superselection charges. The construction of the inner degrees of freedom, as well as the study of their transformation properties (quantum symmetry), are entirely in terms of the superselection structure of the observables. As a novel and characteristic feature for braid group statistics, Clebsch-Gordan and commutation 'coefficients' generically take values in the algebra M of symmetry operators, much as it is the case with quasi-Hopf symmetry. A, F, and M are all C* algebras, i.e. represented by bounded operators on a Hilbert space with positive metric. (orig.).

35238 (DESY–91-052) **Signatures of unstable particles in finite volume.** Luescher, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 20p. Order Number DE92714437. Source: OSTI; NTIS (US Sales Only); INIS.

Unstable particles (resonances) occur in QCD, the Higgs model and many other quantum field theories of interest. Since they are a dynamical phenomenon, showing up in scattering processes of stable particles, it is not obvious how to extract their masses from numerical simulations of the theory in euclidean space. For resonances in the elastic region, a solution to this problem in proposed here on the basis of a recently established relation between the scattering matrix in infinite volume and the two-particle energy spectrum in a periodic box. (orig.).

35239 (DESY–91-060) **Quasi quantum group symmetry and local braid relations in the conformal Ising model.** Mack, G. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik); Schomerus, V. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 10p. Order Number DE92714428. Source: OSTI; NTIS (US Sales Only); INIS.

We propose that the true quantum symmetries of minimal conformal models are weak quasitriangular quasi Hopf algebras ('quasi quantum groups') canonically associated with $U_q(sl_2)$, rather than the quantum group algebras $U_q(sl_2)$ themselves. We show by construction that the conformal Ising model admits quasi Hopf covariant field operators which obey quasi Hopf covariant operator product expansions and local braid relations. Both are valid as operator identities on the whole positive definite physical Hilbert space. (orig.).

35240 (DESY–91-062) **Dirac versus Wigner: Towards a universal particle concept in local quantum field theory.** Buchholz, D. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik); Porrmann, M.; Stein, U. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jun 1991. 10p. Order Number DE92714445. Source: OSTI; NTIS (US Sales Only); INIS.

Based on the concept of particle weight a unified description of stable particle like systems in local quantum field theory is given which applies also to so called infraparticles. Particle weights carry definite charge, four momentum and spin and give rise to characteristic mass shell singularities. A collision theory for these weights is proposed which allows to calculate transition probabilities directly from local gauge invariant operators. (orig.).

In *Proceedings of workshop on the development and construction of gravitational wave emitter and detector.* 154p. Order Number DE92001311. Source: OSTI; NTIS (US Sales Only); INIS.

Relativistic kinematics of the relative motion is discussed. A general scheme of solving the problem in the general case of vector fields using differentiable manifolds with affine connection and metric is obtained. 11 refs.; 2 tabs.

35242 (LA-UR–91-3023) **Monte Carlo approaches to effective field theories.** Carlson, J. (Los Alamos National Lab., NM (United States)); Schmidt, K.E. Los Alamos National Lab., NM (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9108142–3: Recent progress in many-body theories, Minneapolis, MN (United States), 26-31 Aug 1991). Order Number DE92000198. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we explore the application of continuum Monte Carlo methods to effective field theory models. Effective field theories, in this context, are those in which a Fock space decomposition of the state is useful. These problems arise both in nuclear and condensed matter physica. In nuclear physics, much work has been done on effective field theories of mesons and baryons. While the theories are not fundamental, they should be able to describe nuclear properties at low energy and momentum scales. After describing the methods, we solve two simple scalar field theory problems; the polaron and two nucleons interacting through scalar meson exchange. The methods presented here are rather straightforward extensions of methods used to solve quantum mechanics problems. Monte Carlo methods are used to avoid the truncation inherent in a Tamm-Dancoff approach and its associated difficulties. Nevertheless, the methods will be most valuable when the Fock space decomposition of the states is useful. Hence, while they are not intended for ab initio studies of QCD, they may prove valuable in studies of light nuclei, or for systems of interacting electrons and phonons. In these problems a Fock space decomposition can be used to reduce the number of degrees of freedom and to retain the rotational symmetries exactly. The problems we address here are comparatively simple, but offer useful initial tests of the method. We present results for the polaron and two non-relativistic nucleons interacting through scalar meson exchange. In each case, it is possible to integrate out the boson degrees of freedom exactly, and obtain a retarded form of the action that depends only upon the fermion paths. Here we keep the explicit bosons, though, since we would like to retain information about the boson components of the states and it will be necessary to keep these components in order to treat non-scalar of interacting bosonic fields.

35243 (LBL–31192) **Recent developments in the Virasoro master equation.** Halpern, M.B. Lawrence Berkeley Lab., CA (United States). 3 Sep 1991. 17p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant PHY90-21139. (CONF-9105113–3: Strings and symmetries conference, Stony Brook, NY (United States), 20-25 May 1991; UCB-PTH–91/43). Order Number DE92000811. Source: OSTI; NTIS; INIS; GPO Dep.

The Virasoro master equation collects all possible Virasoro constructions which are quadratic in the currents of affine Lie g. The solution space of this system is immense, with generically irrational central charge, and solutions which have so far been observed are generically unitary. Other developments reviewed include the exact C-function, the superconformal master equation and partial classification of solutions by graph theory and generalized graph theories. 37 refs., 1 fig., 1 tab.

CERN has accelerated ions of mass 16 (oxygen) to energies of 60 and 200 GeV/nucleon and of mass 32 (sulfur) to energies of 200 GeV/nucleon. This yields total energies of 960 GeV and 3.2 TeV for the $^{16}O$ and 6.4 TeV total for the $^{32}S$. Upgrade plans for CERN call for construction of a high-frequency ECR source capable of producing $^{208}Pb$ in charge state 25-30$^{+}$. One can obtain information on the global distribution of energy and produced particles in heavy-ion reactions by measuring the transverse energy and number of produced particles as a function of pseudorapidity and azimuth over a large region centered at mid-rapidity. The energy measurements are accomplished in the usual way via a set of calorimeter towers divided into electromagnetic and hadronic compartments. The multiplicity measurements are performed using large acceptance tracking devices (streamer chambers or TPCs) or large arrays of larrocci-type streamer tubes with pad readout. Using a suggestion of Bjorken it is possible to relate the measured transverse energy per unit rapidity, $dE_T/dy$, to the energy density produced in the reaction, modulo an uncertainty arising from an imperfect knowledge of the proper time required for the final state particles to hadronize. If the particle multiplicity proved to be a linear function of the transverse energy (or vice versa), as it is found to be, it is also possible to estimate the energy density from the particle multiplicity. It should also be possible to relate the entropy density to the observed particle multiplicity. Some experimental results of $^{32}S$ collisions on $^{197}Au$, Ag, Cu, and $^{27}Al$ and $^{11}O$ collisions on Cu, Ag, $^{197}Au$, $^{12}C$ are given.

It is believed that a good bet for finding the Quark-Gluon Plasma at AGS energies is with the heaviest projectiles on the heaviest target, i.e. Au on Au. One of the likely signatures of the plasma is strangeness enhancement. Al Saulys has shown what it's like to find $\Lambda$ and $K^{O}$ with Si projectiles. The Monte Carlo simulations show track densities 4× higher for Au projectiles. In addition, the Au beam itself produces 30 times more ionization. Thus the present TPC's will be limited to only a few hundred ions per sec.

Data for the production of protons, deuterons and antiprotons in p + A and Si + A collisions using the E802 spectrometer at the BNL AGS are presented. For protons, the spectrometer acceptance ranges from rapidities y of 0.5 to roughly 1.7 (the beam rapidity for 14.6 A·GeV/c projectiles is 3.44) and transverse momenta $p_\perp$ greater than roughly 0.3 GeV/c. Because of limited statistics, data for antiproton production are limited to the rapidity range of 1.1 to 1.6. The invariant cross sections of protons, deuterons and antiprotons at fixed rapidity are well described by exponentials in transverse mass $m_\perp \equiv \sqrt{m_o^2 + p_\perp^2}$, dramatically increases both as a function of the combined projectile and target mass and as a function of rapidity. Results for dN/dy are also presented and comparisons with models are shown.

In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

In experiments with the CERN-SPS beams of oxygen and sulphur ions, large initial energy densities in excess of 2 GeV/fm$^3$ have been observed in collisions with heavy nuclear targets. According to QCD calculations on the lattice the deconfinement of quarks and gluons may start to set in at such energy densities. Some interesting signals such as suppression of J/Ψ production and an unexpectedly large pion emission region were seen. The analysis of the data taken by the CERN experiments in 1986 and 1987 has continued and recent preliminary results on pion interferometry (experiments NA35, WA80), strangeness production (experiments NA34, NA35, NA38, WA85) and $p_T$-spectra (experiment NA35) will be shown. Data taking with improved detectors and two new experiments will resume at CERN this year with sulphur beams and is expected to continue in 1991.

**35249** (BNL–44911, pp. 300-313) **Dilepton production: Results from the Bevalac extensions to the AGS.** Schroeder, L.S. (Lawrence Berkeley Lab., CA (USA)). Brookhaven National Lab., Upton, NY (United States). [1990]. DOE Contract AC03-76SF00098. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). A central focus of studying nucleus-nucleus collisions at energies ranging from the Bevalac to the AGS and SPS and eventually at RHIC, is the study of nuclear matter under extreme conditions of density and temperature. In order to achieve these conditions experimentally, one concentrates on the central collisions of the heaviest systems possible. Since the transient hot, dense phase is only expected to be present for the order of 1-3 × $10^{-23}$ seconds, one needs to seek experimental probes which will be sensitive to these early times as well as being able to survive this phase and the subsequent expansion and cooling to carry a signal to the outside world (i.e., the author's detectors). The ordinary hadrons, such as pions and protons, are strongly interacting particles which suffer considerable absorption and rescattering after production in such an environment. Thus, they are generally expected to reflect the surface properties of the system, i.e., after the expansion and cooling and eventually decoupling of the matter. However, photons and dileptons due to their weak coupling to matter, should be excellent probes of the early stages of the collision. Therefore, they are a penetrating probe which can provide relatively undistorted information concerning their creation. In addition, since they arise from electromagnetic interactions, detailed calculations can in principle be readily carried out for comparison with the experimental data.

**35250** (BNL–44911, pp. 384-401) **Studying extremely peripheral collisions of relativistic heavy ions.** Fatyga, M. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7

Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

Relativistic heavy ion facilities have been proposed (and in some cases constructed) with an intent to search for a new state of matter, a quark gluon plasma. As with all tools in the experimental physics, one should always search for ways in which relativistic heavy ions can be used to study physical phenomena beyond this original goal. New possibilities for a study of higher order photonuclear excitations in extremely peripheral collisions of relativistic heavy ions are discussed in this contribution. Data on the electromagnetic and nuclear fragmentation of a 14.6Gev/nucleon $^{28}Si$ projectile are presented.

The correlations in relative momentum between identical bosons are determined, in part, by the geometrical properties of the boson source. This fact was first exploited in hadron physics by Goldhaber, Goldhaber, Lee and Pais (GGLP) in 1960. In the intervening three decades, this approach has been applied to lepton-lepton, lepton-hadron, hadron-hadron, and heavy-ion collisions. A word about nomenclature: The correlations in relative momentum between identical mesons arise from Bose statistics. Even previous to GGLP, this fact was applied by Hanbury-Brown and Twiss to measure stellar radii via two-photon interferometry. Thus an alternative name for the GGLP effect is the HBT effect. An informal introduction to Hanbury-Brown-Twiss measurements in heavy ion collisions is presented. The systematic effects in interpreting such data are emphasized, rather than the implications of any single experiment.

Relativistic heavy ion collisions in the central regime are characterized by the formation of dense, hot hadronic matter, or with luck, a region of quark-gluon plasma. The multiplicity of particles emitted from this zone of dense matter is large. In addition to pions, the dominant component, one also finds antiprotons, strange particles ($K^{\pm}$, $\Lambda\cdots$) and charmonium in the collision debris. The author discusses the production of antimatter, multiply strange objects and stable multiquark systems containing both strange and charmed quarks ($\bar{c}suud$). The possibilities for studies of charm production at RHIC energies are probed.

The purpose of this workshop was to review the status of the current AGS experimental program on light ion collisions with heavy target nuclei in the laboratory energy range 10-15 AGeV, to debate what the present data may be teaching us about the physics of such reactions, and to evaluate the prospects of producing and diagnosing extreme baryon dense matter when truly heavy ion beams become available around 1992-3. This report presents the closing talk of the workshop on AGS heavy ion program held at BNL March 5-7, 1990. The emphasis is on new questions posed by the new data presented at this meeting with emphasis on the pion-proton puzzle.

**35255** (BNL–46573) **Physics opportunities with PILAC.** Chrien, R.E. Brookhaven National Lab., Upton, NY (United States). [1991]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9108167–1: Annual LAMPF users meeting, Los Alamos, NM (United States), 19-20 Aug 1991). Order Number DE92000128. Source: OSTI; NTIS; INIS; GPO Dep.

In the Long Range Plan prepared in 1989 for nuclear science in the 1990's, this nation's ability to maintain nuclear science at the "intellectual cutting edge" was addressed. In this document a number of facilities designed to do this were cited, including the CEBAF electron accelerator and the RHIC heavy ion accelerator. Beyond these facilities the Report noted the scientific opportunities available with a high intensity hadron facility and emphasized the importance of studies of the strong force which determines nuclear dynamics. My object in this brief survey is to discuss the physics research available in this area based on a relatively modest–at least by current standards–upgrade of the Los Alamos Meson Physics Facility, which will provide an important new tool for hadronic studies: that is PILAC, a source of pions with momenta in excess of 1 GeV/c. With PILAC a host of new opportunities for physics with pions free of the dominance of the $P_{33}$ resonance is available.

**35256** (DOE/ER/40256–6) **[Cyclotron based nuclear science]: Progress report April 1, 1990–March 31, 1991.** Texas A and M Univ., College Station, TX (United States). Cyclotron Inst. Aug 1991. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40256. Order Number DE91018530. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains descriptions of research programs carried out by Institute staff, as well as progress on new instrumentation during the period, April 1, 1990, to March 31, 1991. The K500 cyclotron and ECR source provided beam for 4140 hours during the period. The beam was actually available for experiments 1927.50 hours and 1110.50 hours was devoted to developing new beams and exploring cyclotron performance. A wide range of beams from protons to Xe with energies from 2.4 MeV/u to 60 MeV/U have been used in experiments. The highest total energy beam accelerated was 35 MeV/u $^{63}Cu$. The ECR source, made a tremendous improvement in accelerator performance and reliability. Substantial amounts of beam time were devoted to investigations of hot nuclei, electron-positron, giant resonances, atomic effects of high velocity ion beams, astrophysics related reactions and proton and alpha bremsstrahlung. Scientific accomplishments included determination of the heat capacity of nuclei through new insight into the level densities and establishing a lower limit for electron positron resonances a factor of ten better than previous measurements. The proton spectrometer, constructed for studies of the Gamow-Teller interaction is complete, and initial physics measurements will be made in the next few months. All of the $BaF_2$ crystals have been delivered and acceptance tests are underway. A K=315 MDM spectrometer has been obtained from Oxford University and is scheduled for installation in Spring 1992, after removal of the K=150 Enge split pole spectrometer. Institute groups continue participation in MEGA, instrumentation projects for RHIC, and few nucleon studies at LAMPF and KEK. Reports of these activities are included.

The research program of our group touches five areas of nuclear physics: (1) Nuclear structure studies at high spin; (2) Studies at the interface between structure and reactions; (3) Production and study of hot nuclei; (4) Incomplete fusion and fragmentation reactions; and (5) Development and use of novel techniques and instrumentation in the above areas of research. The papers from these areas are discussed in this report.

The development of the "cold-fusion" episode is reviewed. Ongoing studies of compound-nucleus formation and decay via the neutron multiplicity distribution confirm the validity of conventional statistical theory. The excitation energy partition in near-barrier damped $^{58}Ni + ^{208}Pb$ collisions is found to be largely independent of the direction of net mass transfer, supporting a diffusion-like nucleon-exchange mechanism. Exclusive experiments on the heavy reaction systems $^{197}Au + ^{208}Pb$ and $^{209}Bi + ^{136}Xe$ in the Fermi-energy domain have revealed important new insights into the reaction mechanism, which is found to be dominated by damped, binary processes. The effectiveness of the neutron multiplicity as an impact-parameter filter is demonstrated. It is shown that very-heavy-ion reactions lead to transient nuclear systems with temperatures in excess of $\tau = 6$ MeV and transfer of large, aligned spins to reaction fragments. The first measurements of neutrons in coincidence with kinematically identified reaction fragments provide evidence for the binary, sequential character of dissipative collisions in the Fermi-energy domain. Also for the first time, a full event characterization was achieved for nuclear reactions in terms of neutrons and charged particles. Technical information on this experiment is provided. First results yield strong evidence for dominantly binary primary reaction dynamics of even highly dissipative $^{209}Bi + (28MeV/u)\ ^{136}Xe$ collisions, associated with several intermediate-mass fragments.

Recent developments and advances in heavy ion research at low and intermediate energies are reviewed. Emphasis is layed on the progress of accelerator technology, especially in producing high phase space density heavy ion beams in cooler-storage rings. A report is presented on some selected topics of current interest in nuclear structure research such as the production of super-heavy elements, the excitation of multi-phonon vibrational states and giant-dipole resonances. Nuclear dynamics studies from the Coulomb barrier to relativistic energies will be addressed including the production of dense heated and excited nuclear matter and the study of the properties of hadrons in such a medium. Finally, some atomic physics experiments with heavy ions will be presented with emphasis on quasi-atomic $e^+e^-$ pair production. (orig.).

The scientific research on nuclear physics started in China in late 1950s. At that time, a research reactor and some accelerators were built in the Institute of Atomic Energy, Beijing, and nuclear data measurement was carried out. Nuclear data compilation and evaluation were begun systematically only in 1975 when the Chinese Nuclear Data Center (CNDC) and the Chinese Nuclear Data Coordination Network (CNDCN) were set up in order to meet the requirement for developing nuclear energy, science and engineering technology. Since China was not an IAEA member at that time, only very few data from foreign publications were able to be obtained, and the own evaluation had to be done to serve our users. This situation has changed since the CNDC established the contact with IAEA/NDS, JAERI/NDC and BNL/NNDC in 1980. Especially in 1984, when the People's Republic of China became an IAEA member, international cooperation and exchange increased. CNDC, CNDCN, working groups and Chinese Committee of Nuclear Data and their objectives are described. The activities on nuclear data evaluation, the progress of nuclear data measurement and the development for future are reported. (K.I.).

**35265** (LBL–26024) **GAMUT: A computer code for $\gamma$-ray energy and intensity analysis.** Firestone, R.B. Lawrence Berkeley Lab., CA (United States). May 1991. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000691. Source: OSTI; NTIS; INIS; GPO Dep.

GAMUT is a computer code to analyze $\gamma$-ray energies and intensities. It does a linear least-squares fit of measured $\gamma$-ray energies

from one or more experiments to the level scheme. GAMUT also performs a non-linear least-squares analysis of branching intensities. For both energy and intensity data, a statistical Chi-square analysis is performed with an iterative uncertainty adjustment. The uncertainties of outlying measured values and sets of measurements with $x^2/f>1$ are increased, and the calculation is repeated until the uncertainties are consistent with the fitted values. GAMUT accepts input from standard or special-format ENSDF data sets. The special-format ENSDF data sets were designed to permit analysis of more than one set of measurements associated with a single ENSDF data set. GAMUT prepares a standard ENSDF format output data set containing the adjusted values. If more than one input ENSDF data set is provided, GAMUT creates an ADOPTED LEVELS, GAMMAS data set containing the adjusted level and $\gamma$-ray energies and branching intensities from each level normalized to 100 for the strongest $\gamma$-ray. GAMUT also provides a summary of the results and an extensive log of the iterative analysis. GAMUT is interactive prompting the user for input and output file names and for default calculation options. This version of GAMUT has adjustable dimensions so that any maximum number of data sets, levels, and $\gamma$-rays can be established at the time of implementation. 6 refs.

This report contains short papers of research conducted in the following areas: Low energy research program; bevalac research program; ultrarelativistic research program; nuclear theory program; nuclear data evaluation; and, 88-inch cyclotron operations.

**35267** (NIFS-DATA–11) **Partial and total electronic stopping cross sections of atoms for a singly charged helium ion, (1).** Kaneko, T. (and others); Nishihara, T.; Taguchi, T. National Inst. for Fusion Science, Nagoya (Japan). Mar 1991. 70p. Order Number DE92704305. Source: OSTI; NTIS (US Sales Only); INIS.

Partial and total electronic stopping cross sections of atoms with Z ($2 \leq Z \leq 54$) for a $He^+$ ion are tabulated and discussed on the basis of the wave-packet theory. The wave packet theory for the stopping of bound electrons has recently been developed. The main thrust of the wave packet theory is the use of momentum space representation to describe bound electrons, where the localized nature is held in the momentum distribution function. This theory yields the electronic stopping cross section of atoms and solids, and the energy-loss straggling of atoms for protons on the independent shell model. The aim of this report is to present tables of the partial and total electronic stopping cross sections for a $He^+$ ion in collisions with neutral target atoms. In this method, the core electrons belonging to an atomic shell classified by (n, 1) (n: principal quantum number, 1: angular momentum quantum number) are considered to be identical. The ensemble of such identical electrons is regarded as a wave packet of a degenerate electron gas governed by the momentum occupation probability W(q) for momentum q. (N.K.).

The viability of a symbiotic combination of Muon Catalyzed Fusion ($\mu$CF) and high density generation processes has been investigated. The muon catalyzed fusion reaction rates are formulated in the temperature and density range found under moderate compressive conditions. Simplified energy gain and power balance calculations indicate that significant energy gain occurs only if standard type deuterium-tritium (dt) fusion is ignited. A computer simulation of the hydrodynamics and fusion kinetics of a spherical deuterium-tritium pellet implosion including muons is performed. Using the muon catalyzed fusion reaction rates formulated and under ideal conditions, the pellet ignites (and thus has a significant energy gain) only if the initial muon concentration is approximately $10^{17}$ $cm^{-3}$. The muons need to be delivered to the pellet within a very short-time ($\simeq$ 1 ns). The muon pulse required in order to make the high density and temperature muon catalyzed fusion scheme viable is beyond the present technology for muon production. (orig.).

Source: OSTI; NTIS (US Sales Only).

The present work deals with experimental results obtained for proton - nucleus collisions at 0.8 and 1.6 GeV on-carbon, niobium and lead targets. The observables studied are essentially proton - like multiplicities, and pion multiplicity distributions for both $\pi^+$ and $\pi^-$ characterized by their mean values and dispersions for two types of collisions: peripheral and central. Such data are fundamental to check the ingredients of the foregoing transport theories. In the present work, we restrict ourselves just to a comparison to the LIEGE INC code with the ingredients. Detailed description of experimental set-up, data reduction procedure and experimental results are in process to be published. Only, just trigger and detector acceptances used for the analysis will be recalled.

35272 (GSI–91-14) **Excitation of the Δ resonance in proton-nucleus collisions.** Trzaska, M. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany); Heidelberg Univ. (Germany). May 1991. 121p. (In German). Order Number DE92704490. Source: OSTI; NTIS (US Sales Only); INIS.

In the proton-nuclus reactions p+A (A=C, Nb, Pb) at 0.8 and 1.6 GeV incident energy strong correlations between produced pions and protons in the final state can be observed. By means of different Monte-Carlo approaches these are completely explained from the decay of Δ(1232) resonances. For none of the studied systems the extracted resonance energies agree with those of the free Δ resonance. With increasing multiplicity of the event the effective mass is instead systematically shifted by 10 MeV to 70 MeV to smaller energies. The effective decay widths are compatible with the free values. An equivalent analysis of the INC data sets yields a similar behaviour of the resonance parameters in dependence on the multiplicity. From this the conclusion is to be drawn that the manifold scattering processes of the baryons and mesons, as they are modelled in the cascade, are responsible for an effective shift of the resonance mass. The mass distribution of the Δ's at the end of the collision process is solely determined by the available phase space, because the parameters applied in the model are those of the free resonance. An in-medium modification of the free Δ mass cannot be inferred because of the dominance of the kinematical effects and remaining systematic uncertainties of an absolute comparison of experiment and model. The explicit regardment only of the Δ degree of freedom in the applied model allows to detect by comparison of simulated mass spectra with the corresponding experimental distributions qualitatively contributions also of higher resonances. These are especially present in the $(p,\pi^-)$, but also in $(p,\pi^+)$ correlations. A resolution of the resonance structure is not possible, because the effective mass shift leads here to a broad energy distribution. (orig./HSI).

35273 (LBL–31125) **Dynamic-angle spinning and double rotation of quadrupolar nuclei.** Mueller, K.T. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Jul 1991. 256p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000837. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear magnetic resonance (NMR) spectroscopy of quadrupolar nuclei is complicated by the coupling of the electric quadrupole moment of the nucleus to local variations in the electric field. The quadrupolar interaction is a useful source of information about local molecular structure in solids, but it tends to broaden resonance lines causing crowding and overlap in NMR spectra. Magic- angle spinning, which is routinely used to produce high resolution spectra of spin-$\frac{1}{2}$ nuclei like carbon-13 and silicon-29, is incapable of fully narrowing resonances from quadrupolar nuclei when anisotropic second-order quadrupolar interactions are present. Two new sample-spinning techniques are introduced here that completely average the second-order quadrupolar coupling. Narrow resonance lines are obtained and individual resonances from distinct nuclear sites are identified. In dynamic-angle spinning (DAS) a rotor containing a powdered sample is reoriented between discrete angles with respect to high magnetic field. Evolution under anisotropic interactions at the different angles cancels, leaving only the isotropic evolution of the spin system. In the second technique, double rotation (DOR), a small rotor spins within a larger rotor so that the sample traces out a complicated trajectory in space. The relative orientation of the rotors and the orientation of the larger rotor within the magnetic field are selected to average both first- and second-order anisotropic broadening. The theory of quadrupolar interactions, coherent averaging theory, and motional narrowing by sample reorientation are reviewed with emphasis on the chemical shift anisotropy and second-order quadrupolar interactions experienced by half-odd integer spin quadrupolar nuclei. The DAS and DOR techniques are introduced and illustrated with application to common quadrupolar systems such as sodium-23 and oxygen-17 nuclei in solids.

A simultaneous determination of the transverse energy produced, and the multiplicity of beam rapidity nucleons surviving nucleus interactions provides an effective way to quantify the extent of stopping achieved therein. The authors have studied collisions between $^{28}$Si projectiles with energies $E_{lab}/A$ = 14.6 GeV and targets of Al, Cu, and Pb. Transverse energy production has been measured calorimetrically in a pseudorapidity interval $-0.5 < \eta < 0.8$, and correlated with the multiplicity of beam rapidity protons and neutrons detected in a 0.8° cone centered on the beam direction. Theoretical calculations have been performed to describe the data, and demonstrate quantitatively the large amount of nuclear stopping in these collisions. They also indicate the importance of rescattering in the production of transverse energy.

The Brookhaven experiment E-802 has several detectors to study global event characterization. These are the Zero Degree Calorimeter (ZCAL), a Lead Glass Array to study neutral energy emission, and a charged particle target multiplicity array (TMA). All of these can be used to characterize central events, but each measures different aspects of the collision. This report is concerned with results from the TMA. Data on charged particle distributions from reactions with Si and O projectiles on targets of Al, Cu, Ag, and Au are presented. Systematic features of the pseudorapidity distributions are discussed.

35277 (BNL–44911, pp. 44-69) **$E_T$ distributions, nuclear stopping, and correlations among measurements from the 4 detector systems in AGS E802.** Tannenbaum, M.J. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). The E802 experiment contains four detector systems: a magnetic spectrometer with good particle identification over the momentum range $0.5 \leq p \leq 4.7$ GeV/c; a zero degree calorimeter (ZCAL) for detecting the forward energy, $E_F$, remnants of the projectile after an interaction: a target multiplicity array (TMA) for measurements of charged particles over the full phase space; and a highly segmented lead glass array (PbGl) for measurements of neutral energy flow and relativistic particle production in the central region of rapidity. Much can be learned from the study of the correlation of measurements in these 4 detectors. Experimental data is given and correlated for $^{28}S$, $^{16}O$ and protons on various targets.

A topic presently of considerable discussion is the character and evolution of the hot, dense matter thought to be formed when relativistic nuclei undergo catastrophic central collisions. The concentration of strange matter in such reactions is of some interest in this regard. Were a plasma of quarks and gluons formed, one might expect to observe a substantial increase in the concentration of strange matter, as a consequence of Pauli-blocking of u, d, quark production. The authors report here the first observation of inclusive $\Lambda^0$, $\bar{\Lambda}^0$, $K_s^0$ production in nucleus-nucleus collisions at 14.5 GeV/n.

Calculation results of the rates of radiation damage in iron for the ANO, U-235, CFRMF, PS1 and PS2 neutron spectra unfolded by the measured reaction rates by means of the STAYSL code are presented. The cross-section files ZACRSS and BOSPOR, being developed in the USSR for neutron metrology are discussed. In the ENDF/B format the results of new evaluation of neutron radiation capture cross-sections for the $^{23}Na$, $^{37}Cl$, $^{55}Mn$, $^{63}Cu$, $^{139}La$ and $^{186}W$ isotopes are presented. (author). 63 refs, 9 figs, 6 tabs.

35280 (GSI–91-31(prepr.)) **Gamow-Teller beta decay of the very neutron-deficient N=50 nuclide $^{98}Cd$.** Plochocki, A. (Warsaw Univ. (Poland). Inst. Fizyki Doswiadczalnej); Rykaczewski, K.; Batsch, T.; Szerypo, J.; Zylicz, J.; Gabelmann, H.; Hill, P.; Ravn, H.; Thorsteinsen, T.; Grant, I.S.; Grawe, H.; Manakos, P. ISOLDE Collaboration. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jun 1991. 26p. Order Number DE92714424. Source: OSTI; NTIS (US Sales Only); INIS.

For the first time, detailed decay-spectroscopic investigations were performed for the very neutron-deficient N=50 nuclide $^{98}Cd$. The $^{98}Cd$ activity was produced in spallation reactions between 600 MeV protons and a natural tin target, yielding a $^{98}Cd$ beam intensity of 10 to 60 atoms per second at the collector of the ISOLDE mass-separator. By means of $\gamma$-ray and conversion-electron spectroscopy, 19 transitions were found to follow the $\beta^+$/EC decay $^{98}Cd \rightarrow {}^{98}Ag$. The transitions at 61 and 107 keV were shown to be M1(+E2) and E2, respectively, and the $^{98}Cd$ half-life was measured as $9.2 \pm 0.3$ s. The $Q_{EC}$ value of $^{98}Cd$ is determined semiempirically and is compared to model predictions together with the measured $Q_{EC}$ values of the N=50 isotones $^{92}Mo$, $^{94}Ru$, and $^{96}Pd$ taken from the literature. The newly established decay scheme of $^{98}Cd$ includes 9 excited states of $^{98}Ag$. Four states at 1691, 1861, 2164, and 2544 keV are directly fed by $0^+ \rightarrow 1^+$ Gamow-Teller beta transitions with a summed strength of $3.5_{-0.7}^{+0.8}$. This value corresponds to $25 \pm 5\%$ of the strength predicted for the GT transformation of a $g_{9/2}$ proton (in $^{98}Cd$) into a $g_{7/2}$ neutron (in $^{98}Ag$) by the extreme single-particle shell model with pairing. The GT-strength splitting and quenching, observed for $^{98}Cd$, are compared with the corresponding data for lighter even-even N=50 isotones, and are discussed with reference to the predictions of more sophisticated nuclear models. Within the framework to the shell-model, we find that it is possible to explain qualitatively the observed GT strength distribution and its total magnitude without renormalizing the free-neutron value of the axial-vector coupling constant. (orig.).

35281 (ANL/CP–72878) **Superdeformed nuclei.** Janssens, R.V.F.; Khoo, Teng Lek. Argonne National Lab., IL (United States). [1991]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9109278–1: International Joliot-Curie summer school of nuclear physics, Maubuissen (France), 16-21 Sep 1991). Order Number DE92000269. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reviews the most recent advances in the understanding of the physics of superdeformed nuclei from the point of view of the experimentalists. It covers among other subjects the following topics: (1) the discovery of a new region of superdeformed nuclei near A=190, (2) the surprising result of the occurrence of bands with identical transition energies in neighboring superdeformed nuclei near A=150 and A=190, (3) the importance of octupole degrees of freedom at large deformation and (4) the properties associated with the feeding and the decay of superdeformed bands. The text presented hereafter will appear as a contribution to the Annual Review of Nuclear and Particle Science, Volume 41. 88 refs., 11 figs.

Submitted to the Conference on Nuclear Spectroscopy and Atomic Nucleus Shape, Leningrad (SU), Apr 1990 and to the journal Izv. Akad. Nauk SSSR, Ser. Fiz.

The alpha decay of $^{155}Tm$ on experimental sets for studying nuclei far from beta-stability line - YaSNAPP-2 has been investigated. Two components of $^{155}Tm$ $\alpha$ decay disintegration curve with $T_{1/2}$ = 23(3) s and $T_{1/2}$ 47(6) s for $E_\alpha$ = 4462 keV have been observed. It is concluded that the ground state of $^{155}Tm$ has spin and parity $11/2^-$ and $T_{1/2}$ = 23(3) s and isomeric one with 41(6) keV - $1/2^+$ and $T_{1/2}$ = 47(6) s. $b_\alpha$ $N_\alpha/N_\alpha + N_\beta$ values for $\alpha$ decay of

$^{155}$Tm and $^{151}$Ho are obtained notably: $b_\alpha(^{155}Tm)$ = 0.012(6) and $b_\alpha(^{151}Ho)$ 0.47(8). 18 refs.; 3 figs.

The tracking detector of AGS Experiment 810 is a three-piece Time Projection Chamber (TPC) intended to measure all charged tracks in the forward hemisphere of the nucleon-nucleon center of mass system, i.e. forward of an angle of about 20 degrees in the lab. Each module of the TPC contains twelve rows of short anode wires which give 3-D space points on each track, but no dE/dx information useable for particle identification. The TPC was operated in a beam of silicon ions at the end of June 1989 and this talk reports the results of analysis of the data taken with a thin gold target in that run. The authors have gathered a similar amount of data from thin copper and silicon targets, the analysis of which is in a less advanced state. The results of the investigation of the neutral strange particle decays appear in a separate contribution by Al Saulys. This paper presents the current state of the analysis of the charged tracks from the silicon gold collisions.

The measurement of transverse momentum spectra for identified particle species in central collisions of relativistic heavy ions is of great interest for the determination of parameters which describe the phase of high density matter presumably formed in these collisions. If thermal equilibrium is reached in a heavy ion collision, then the transverse momentum distribution of the emitted particles is related to the freeze-out temperature T of the particle species under consideration. For a single source Boltzmann-distribution T would be obtained, e.g., by fitting a distribution of the form $A\ m_T \exp(-m_T/T)$ to the measured transverse momentum spectrum, where $m_T = \sqrt{m_0^2 + p_T^2}$. In this contribution the authors show first results for neutron spectra for $E_{lab}/A$ = 14.6 GeV Si + Pb collisions in the $p_T$-range 0-250 MeV/c for a rapidity range y = 2-3.85. Neutrons are identified by the measurement of their energy deposit and time-of-flight measured in the U/Cu/Sc calorimeter modules of the forward spectrometer. The performance of these calorimeters is described in detail. The kinetic energy, as well as the x- and the y-position of single isolated neutrons is obtained by reconstructing clusters using a pattern-recognition algorithm. Charged particles are identified by their signal in the scintillator wall in front of the calorimeters and rejected from the sample. Other possible contaminations in the neutron spectra are decay gamma rays from $\pi^0$'s generated in the reaction and background (secondary neutrons and gammas) generated by particles interacting in the steel of the spectrometer magnets. Monte Carlo studies and comparison with preliminary spectra obtained for protons indicate that this background is completely negligible for neutron rapidities $y \geq 2.5$ and is estimated to be less than 15% in the lowest rapidity bin.

**35285** (BNL–44911, pp. 209-226) **$V^0$ production with 14.5 GeV/c silicon beams.** Saulys, A.C. This talk deals with $\Lambda$, $K_s^0$ and $\bar{\Lambda}$ production with 14.5 GeV/c silicon beams. Why study $V^0$ production? Because the study of strangeness is an important part of the search for Quark Gluon Plasma (QGP). Many models predict an enhancement of strangeness in a QGP as compared to the amount of strangeness produced in a superposition of nucleon-nucleon interactions. The amount of enhancement varies from model to model. Even if no QGP is detected at AGS energies using Si beams, it is important to understand the production mechanisms in quantitative detail so that standard nucleon-nucleon production mechanism can be distinguished from QGP formation. The advantage of measuring strangeness production by measuring $V^0$ production is that $V^0$'s can be identified by kinematics without the use of any special particle ID detectors. The disadvantage is that usually large aperture detectors are required. Experiment 810 has the needed large aperture. This talk describes the technique and results of $V^0$ production from $\sim$ 9,000 interactions of Si in a 1 mil (25 micron) Au target recorded in June, 1989.

In the past, the technique of second-order intensity interferometry has been used in order to infer the space-time structure of hadron-hadron and nucleus-nucleus reactions. In the latter case, the observation has been that the measured source size scales with the projectile size. The E802 spectrometer at the Brookhaven AGS has been used in order to obtain two-particle inclusive pion distributions from E/A = 14.6 GeV $^{28}$Si + $^{197}$Au and $^{27}$Al collisions near midrapidity for the nucleon-nucleon system. The author presents preliminary results for the source sizes and lifetimes obtained by fitting the two-particle correlation function.

**35287** (KFK–4870) **Measurements of the Coulomb dissociation cross section of 156 MeV $^6$Li projectiles at extremely low relative fragment energies of astrophysical interest.** Kiener, J. (Kernforschungszentrum Karlsruhe GmbH (Germany, F.R.). Inst. fuer Kernphysik); Gils, H.J.; Rebel, H.; Zagromski, S.; Gsottschneider, G.; Heide, N.; Jelitto, H.; Wentz, J.; Baur, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Kernphysik. Apr 1991. 47p. Order Number DE92711168. Source: OSTI; NTIS (US Sales Only); INIS.

Coulomb dissociation of light nuclear projectiles in the electric field of heavy target nuclei has been experimentally investigated as an alternative access to radiative capture cross sections at low relative energies of the fragments, which are of astrophysical interest. As a pilot experiment the breakup of 156 MeV $^6$Li-projectiles at $^{208}$Pb with small emission angles of the a particle and deuteron fragments has been studied. Both fragments were coincidentally detected in the focal plane of a magnetic spectrograph at several reaction angles well below the grazing angle and with relative angles between the fragments of 0deg-2deg. The experimental cross sections have been analyzed on the basis of the Coulomb breakup

theory. The results for the resonant breakup give evidence for the strong dominance of the Coulomb dissociation mechanism and the absence of nuclear distortions, while the cross section for the non-resonant breakup follow theoretical predictions of the astrophysical S-factor and extrapolations of corresponding radiative capture reaction cross section to very low c. m. energies of the a particle and deuterons. Various implications of the approach are discussed. (orig.).

A new nuclide $^{263}$Ha was produced in the bombardment of a $^{249}$Bk target with 93-MeV $^{18}$O ions. It was detected via spontaneous fission counting and was shown to have a half-life of about 0.5 min. This activity was also separated from the reaction products by automated rapid chemical separations using cation-exchange chromatography in 0.05 M $\alpha$-hydroxyisobutyric acid. After chemical separation, $^{263}$Ha was found to decay by spontaneous fission ($57_{-15}^{+13}$%) and by alpha-emission ($E_\alpha$=8.35 MeV, 43%) with a half-life of $27_{-7}^{+10}$ s. The spontaneous fission fragment energy spectrum is compatible with an average total kinetic energy of about 200 MeV. (orig.).

A major goal in nuclear physics is to understand how nuclear structure comes about from the underlying interactions between nucleons. This requires modelling nuclei as collections of strongly interacting particles. Using realistic nucleon-nucleon potentials, supplemented with consistent three-nucleon potentials and two-body electroweak current operators, we calculate nuclear ground-state properties, such as the binding energy, electromagnetic form factors, and momentum distributions. Other properties such as excited states and low-energy reactions are also calculable in this framework. 22 refs., 5 figs., 4 tabs.

Transverse energy measurements provide a wealth of information on the physics of ultrarelativistic heavy-ion collisions. To begin with they tell one the degree to which the colliding nuclei transfer energy and stop each other. With information about the space-time dynamics of the collisions, transverse energy data enables one to estimate the evolving energy density in the collision volume, a quantity needed to assess the likelihood of quark-gluon plasma formation. Furthermore, since the transverse energy distribution is to a large extent determined by the geometry of the collision, transverse energy is a useful indicator of centrality of collisions. It also provides considerable evidence for the rescattering of secondaries in the medium. Finally, fluctuations in the tails of the transverse energy distributions are an important probe of the independence of or possible coherence among the nucleon-nucleon subcollisions that constitute the first stage of heavy-ion collisions. Since the experimental talks in this workshop have done a rather complete job of presenting the transverse energy data from both BNL and CERN, the focus, as the authors discuss these topics in turn, will be on the theoretical interpretation of the data.

**35291** (BNL–44911, pp. 116-133) **Comparison of string models for heavy ion collisions.** Werner, K. (CERN, Geneva (Switzerland)). Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

An important method to explore new domains in physics is to compare new results with extrapolations from known areas. For heavy ion collision this can be done with string models, which extrapolate from light to heavy systems and which also may be used to extrapolate to higher energies. That does not mean that these string models are only background models, one may easily implement new ideas on top of the known aspects, providing much more reliable models than those formed from scratch. All the models to be considered in this paper have in common that they consist of three independent building blocks: (a) geometry, (b) string formation and (c) string fragmentation. The geometry aspect is treated quite similar in all models: nucleons are distributed inside each nucleus according to some standard parameterization of nuclear densities. The nuclei move through each other on a straight line trajectory, with all the nucleon positions being fixed. Whenever a projectile and a target nucleon come close, they interact. Such an interaction results in string formation. In the last step these strings decay into observable hadrons according to some string fragmentation procedure. The three building blocks are independent, so one can combine different methods in an arbitrary manner. Therefore rather than treating the models one after the other, the author discusses the procedures for string formation and string fragmentation as used by the models. He considers string models in a very general sense, so he includes models where the authors never use the word string, but which may be most naturally interpreted as string models and show strong similarities with real string models. Although very important he does not discuss - for time and space reasons - recent developments concerning secondary scattering.

**35292** (BNL–44911, pp. 134-143) **Secondary interactions in HIJET.** Longacre, R.S. Brookhaven National Lab., Upton, NY (United States). [1990]. DOE Contract AC02-83ER40107 ;AS05-81ER40032 ;AC02-76ER03274. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

This talk deals with the investigation of secondary interactions in proton-nucleus and nucleus-nucleus collisions using the Monte Carlo event generator HIJET. The HIJET generator considers p-A and A-A collisions to be a sum of independent N-N collisions, with the N-N cross section and scattering dynamics not dependent on whether the nucleon has previously participated in an interaction. It is very reasonable to assume that each collision should be well represented by an independent N-N collision, however the cross section for the forward going struck nucleon may be different. For each primary N-N interaction, a call is made to the MINBIAS routine of the program ISAJET - an event generator for high energy N-N interactions. MINBIAS computes the energy loss of the colliding nucleons and production of particles. MINBIAS is based on inclusive high energy N-N interactions forming multi-pomeron chains, with each chain fragmenting according to the Field-Feynman algorithm.

**35293** (BNL–44911, pp. 144-153) **Formation and break-up of hadronic fireballs.** Stachel, J. (State Univ. of New York, Stony Brook (USA)). Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics

at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

Experimental data presently available for beam energies of 14.6 to 200 GeV/nucleon support the picture of a large degree of nuclear stopping that forms the basis of fireball models. While the data clearly exclude the picture of a system emitting particles isotropically, many of the experimental features are in line with predictions from the Landau model. To what extent this indicates the formation of a thermalized system in such relativistic heavy ion collisions is unclear at present. While the amount of experimental data available has grown very much, there are still missing links. At present, the systematics of transverse momentum spectra is not understood well enough to distinguish between the various theoretical conjectures made in the literature. It is still not known to what extent slopes of $p_t$ spectra reflect the temperature of a system at all. One alternative test would be to measure excited state populations of e.g. the nucleon, by determining for instance the abundance thermalization and stopping are nucleon rapidity distributions. There, experimental measurements over the full range of rapidities and as large a $p_t$ range as possible are needed. In particular, to sort out the question of rescattering effects, comparison to symmetric target-projectile combinations is needed. While obviously not all of the observed experimental features are as expected based on the, admittedly very much simplified, assumptions of a thermal model present data certainly do not rule out such a scenario.

**35294** (BNL–44911, pp. 154-175) **Hydrodynamical analysis of transverse momentum distributions in ultrarelativistic heavy ion collisions.** von Gersdorff, H. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). The transverse momentum ($p_T$) distributions of the secondaries produced in high energy heavy ion collisions may be sensitive to the collective fluid flow of the hot hadronic matter initially produced by the colliding nuclei. Recently these distributions have been measured at BNL and CERN, so that a comparison with theoretical models is now possible. In this paper the author calculates these distributions from a longitudinal boost invariant transverse hydrodynamical model which has a deconfining phase transition incorporated in the equation of state. Essentially, this is done by solving numerically the transverse hydrodynamical equations, coupling them with the exact longitudinal scaling solutions and thereby obtaining the evolution of the matter's energy and velocity profile. From these one can calculate the decoupling surface where the matter reaches $T_{dec}$ (the decoupling temperature ~140 MeV) at which point he assumes the system breaks up instantly into free streaming hadrons. Once he knows the space-time location of the decoupling surface and the collective fluid velocity (or rapidity) of the matter on this surface, the calculation (essentially an integral of Bose-Einstein or Fermi-Dirac distributions) of the transverse momentum distribution of the emitted particles can be performed and a comparison with experiment can then be done. The hope is that these $p_T$ distributions are sensitive to the thermal and collective nature of the expanding matter.

**35295** (BNL–44911, pp. 176-181) **Scaling in fragmentation of target spectators.** Csoergo, T. (Central Research Inst. for Physics, Budapest (Hungary)); Zimanyi, J. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). The LUND string picture is a remarkably successful phenomenological description of high energy hadronization processes, occurring in jet events. The FRITIOF model is a combination of the soft collisions occurring in high energy hadron-hadron, hadron-nucleus and nucleus-nucleus collisions, followed by string fragmentation. FRITIOF and also other models for hadronic interaction which try to describe experimental observables as a superposition of nucleon-nucleon collisions describe the pseudorapidity distributions measured in emulsion experiments well, where the angular distribution of relativistic shower particles are measured. However they fail to describe the pseudorapidity distribution of charged particles at target fragmentation and midrapidity. The authors have shown that the FRITIOF model for soft hadronic processes combined with a moving thermal source for target spectator fragmentation describes the measured pseudorapidity distributions of produced hadrons at 14.5 AGeV within 10% error as well as at 60 and 200 AGeV for different targets and $O^{16}$ projectiles. Their model explains why the measured baryon pseudorapidity distributions were proportional for central 60 and 200 AGeV $O^{16}$+B collisions in the target fragmentation region. They are thermal distributions with $T \approx 66$ MeV, moving with $u \approx 0.3c$. They emphasize that the pseudorapidity distribution of the spectators given peaks at $\eta \approx 0.5$ for $b \approx 0.6$ thus the contribution of spectator fragments is not negligible for pseudorapidity $\eta \leq 1.5$.

If the pions which are observed in the recent heavy-ion experiments at CERN and Brookhaven are extrapolated backwards close to the collision time, one finds densities which are clearly above the thermal densities at the transition temperature, commonly estimated to be of order 200 MeV. One can obtain such a high density of quanta in several ways. The authors would like to convince themselves that the observed increase of quanta is due to the phase transition to quark-gluon plasma (QGP) with roughly 10 times the number of pionic degrees of freedom. Higher density can also be achieved raising the temperature. At $T \simeq 320$ MeV, pions reach the density 1.2 $fm^{-3}$. It is not completely ruled out that such a state of overheated pion gas could be formed in the collision process. In a static situation, they believe, e.g. from lattice calculations, that QGP is the stable state at such a temperature. In the short production time and rapid initial expansion this static argument is not necessarily applicable. However, all calculations starting from an initial state of such a high temperature lead to $p_T$-distributions which are much wider than the observed ones. At the presently observed densities another quite plausible possibility - instead of strong heating of pions over the transition temperature - is the formation of dense pion gas far from chemical equilibrium. As has been pointed out earlier, the expanding gas of massive pions will fall off the chemical equilibrium as a result of the small rate of pion number reducing reactions. They have performed numerical calculations of this effect by assuming conservation of pion number and using the equation of state of free gas of massive pions. Even though the increase of chemical potential from zero is considerable (up to 100 MeV), it does not seem to lead to values which are close enough to the mass to change the shape of the spectrum.

**35297** (BNL–44911, pp. 314-317) **Dilepton production theory.** Kapusta, J. (Univ. of Minnesota, Minneapolis (USA)). Brookhaven National Lab., Upton, NY (United States). [1990]. DOE Contract FG02-87ER40328. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). Whenever charged particles collide they radiate real and virtual photons, the virtual ones decaying into lepton pairs. The advantage of observing electromagnetic signals from a strongly interacting many-body system is that they travel relatively unscathed from the production point to the detector. Since production rates are rapidly increasing functions of temperature and density these electromagnetic signals are good probes of the early high temperature and density stage of heavy ion collisions. The purpose of this talk is to

provide an exploratory study of electron-positron radiation from finite temperature and density nuclear matter, and to make some corresponding comparisons with the p(4.9 GeV) + Be measurements of the DLS group.

**35298** (BNL–44911, pp. 344-360) **Energy density, stopping and flow in ultrarelativistic heavy ion collisions.** Sorge, H. (Johann Wolfgang Geothe Univ. Frankfurt am Main (West Germany)); von Keitz, A.; Mattiello, R.; Stoecker, H.; Greiner, W. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

The Lorentz invariant molecular dynamics approach (RQMD) is employed to investigate the space-time evolution of heavy ion collisions at energies ($E_{kin}$ = 10AGeV···200AGeV). The calculations for various nucleus nucleus reactions show a high degree of stopping power. The importance of secondary rescattering at these beam energies is demonstrated. The computed nucleon rapidity distributions are compared to available experimental data. It is demonstrated that nonlinear, collective effects like full stopping of target and projectile and matter flow could be expected for heavy projectiles only. For nuclear collisions in the Booster era at BNL and for the lead beam at CERN SPS the authors predict a stimulating future: then a nearly equilibrated, long lived (8 fm/c) macroscopic volume of very high energy density (> 1 GeV/fm$^3$) and baryon density (> 5 times ground state density) is produced.

**35299** (BNL–44911, pp. 361-370) **Kaon enhancement as an evidence for chiral restoration in hot dense nuclear matter formed in heavy-ion collisions.** Ko, C.M. (Texas A and M Univ., College Station (USA)); Wu, Z.G.; Xia, L.H.; Brown, G.E. Brookhaven National Lab., Upton, NY (United States). [1990]. DOE Contract FG02-88ER40388. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

Kaon production from meson-meson annihilation is enhanced significantly if the hadron masses are reduced in hot dense nuclear matter as a result of the restoration of chiral symmetry. In an expanding fireball model for heavy-ion collisions, the authors demonstrate that the observed enhancement of kaon yield in high energy heavy-ion collisions can be explained by this effect.

In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

The rapidity and/or pseudorapidity spectra of pions produced in nuclear collisions at beam energies of 14.5, 60 and 200 GeV are fit well by gaussian distributions. The many attempts to model ultrarelativistic collisions can be broadly classified into two groups: (i) hydrodynamic models, and (ii) sequential scattering models. Typical examples of the first category are the Landau-Milekhin approach at one extreme and the Bjorken approach at the other. The Lund model based on string dynamics exemplifies the second category. Both of these approaches roughly reproduce the essential features of the rapidity spectra. Whether the similarities of the final results from these two different approaches is due to the smooth behavior of multi-particle final states alone or whether the two approaches are related at a deeper level is a topic presently under scrutiny. Some vexing questions remain for both models. Two examples of these in the hydrodynamic model are the a priori justification of local equilibrium and the appropriateness of boundary conditions. In the string picture, on the other hand, interactions between the strings remain to be included. Here the author entertains the idea that hydrodynamics is applicable and discusses the predictions of the Landau model. Curiously, the discourse regarding the interpretation of the rapidity spectra in the Landau model is somewhat confusing, given its apparent simplicity. He discusses how one might draw erroneous conclusions regarding the predictions of the rapidity spectra as well as the quality of fits predicted by the model. He discusses concurrently how Milekhin's reformulation of Landau's original model makes predictions about these spectra which are potentially interesting.

**35301** (BNL–44911, pp. 459-502) **Physics of the pion liquid.** Shuryak, E.V. Brookhaven National Lab., Upton, NY (United States). [1990]. (CONF-900331–: Workshop on heavy ion physics at the alternating gradient synchrotron (HIPAGS), Upton, NY (United States), 3-7 Mar 1990). In *Proceedings of the workshop on heavy ion physics at the Alternating Gradient Synchrotron (AGS).* 512p. Order Number DE90017639. Source: OSTI; INIS; NTIS.

Excited hadronic matter in the temperature interval T = 100-200 MeV is not an ideal pion gas, but ratehr a liquid, in which attractive interaction among particles plays an important role. Pion dispersion curve is in this case essentially modified by a kind of collective momentum-dependent potential, which becomes important as the quasipion comes to the boundary of the system. The author shows that these effects can provide an explanation for a number of recent experimental puzzles, in particular, for the observed copious production of soft pions and soft photons in high energy hadronic reactions.

**35302** (BONN-ME–91-01) **Photoproduction of charged and neutral pions in nuclei in the Δ-resonance region.** Arends, J. Bonn Univ. (Germany). Physikalisches Inst. Jul 1991. 12p. (CONF-9106194–: International workshop on pions in nuclei, Penyscola (Spain), 2-9 Jun 1991). Order Number DE92714446. Source: OSTI; NTIS (US Sales Only); INIS.

Photonuclear reactions induced by tagged photons in the energy range around the Δ-resonance are discussed. The total hadronic photoabsorption cross section ($\sigma_\gamma^{tot}$) shows a clear evidence for Δ-excitation in nuclei with a universal behaviour for a wide range of nuclear mass numbers. Next, the partitioning into specific reaction channels is studied. The dominant reaction mechanisms are pion production and γ-absorption on a correlated nucleon pair (quasi-deuteron effect), which are clearly visible in inclusive pion and proton energy spectra from light nuclei. The A-dependences of $\sigma_\gamma^{tot}$ and the emission of pions and protons are compared. Whereas pions are strongly absorbed in heavy nuclei, the emission of protons is enhanced, supporting the picture of a two-step γ-absorption mechanism (volume π-production followed by π-absorption). (orig.).

**35303** (CONF-9010183–5) **Inclusive quasielastic and deep inelastic electron scattering at high energies.** Day, D.B. Virginia Univ., Charlottesville, VA (United States). Inst. of Nuclear and Particle Physics. [1990]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40261. From European workshop on hadronic physics with electrons beyond 10 GeV; Dourdan (France); 8-12 Oct 1990. Order Number DE91018755. Source: OSTI; NTIS; INIS; GPO Dep.

With high electron energies a kinematic regime can be reached where it will be possible to separate quasielastic and deep inelastic scattering. We present a short description of these processes which dominate the inclusive spectrum. Using the highest momentum transfer data available to guide our estimates, we give the kinematic requirements and the cross sections expected. These results indicate that inclusive scattering at high q has a yet unfilled potential. 18 refs., 13 figs.

**35304** (DOE/ER/40335–6) **[Theoretical nuclear physics]: Progress report, October 1, 1990–October 1, 1991.** Colorado Univ., Boulder, CO (United States). Dept. of Physics. [1991]. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER40335. Order Number DE92000022. Source: OSTI; NTIS; INIS; GPO Dep.

This report discussed the following topics: Consistent RHA-RPA for finite nuclei; vacuum polarization in a finite system; isovector correlations in QHD description of nuclear matter; nuclear response

functions in quasielastic electron scattering; charge density differences for nuclei near $^{208}Pb$ in quantum hadro-dynamics; excitation of the 10.957 MeV $0^-$; T=0 state in $^{16}O$ by 400 MeV protons; deformed chiral nucleons; new basis for exact vacuum calculations in 3-spatial dimensions; second order processes in the (e,e'd) reaction; scalar and vector contributions to $\bar{p}p \rightarrow \bar{\Lambda}\Lambda$ and $\bar{p}p \rightarrow \bar{\Lambda}\Sigma^0$ + c.c; and radiative capture of protons by light nuclei at low energies.

**35305** (DOE/ER/40537–9) **Interplay between pion absorption and inclusive-inelastic scattering on hydrogen and helium isotopes for 96.5-MeV kinetic energy pions.** Storm, D.W. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40537. (CONF-9109291–1: 5. mesons and light nuclei, Prague (Czechoslovakia), 1-6 Sep 1991). Order Number DE92000825. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of double-differential cross sections for inclusive-inelastic scattering of 96.5-MeV pions from hydrogen and helium isotopes are presented. Differential and angle-integrated cross sections are obtained. Distorted wave impulse approximation calculations are reported. The interplay between inclusive-inelastic scattering and pion absorption is discussed. 13 refs., 5 figs., 1 tab.

Implications of heavy-ion collisions at energies up to 10 TeV/u+10 TeV/u are investigated. In the following we discuss a few intriguing ideas concerning the exploration of ultrarelativistic nucleus-nucleus collisions. We indicate various phenomena which may help to extend our knowledge from planned investigations of elementary particle collisions at future supercolliders. (orig.).

**35307** (GSI–91-29(prepr.)) **Fermionic molecular dynamics for ground states and collisions of nuclei.** Feldmeier, H.; Bieler, K. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Jun 1991. 12p. (CONF-910396–: 1. European biennial workshop on nuclear physics, Megeve (France), 25-29 Mar 1991). Order Number DE92714425. Source: OSTI; NTIS (US Sales Only); INIS.

Fermionic Molecular Dynamics has been proposed as an approximation scheme to solve the many-body problem of interacting identical fermions with spin 1/2. In this model the interacting system is represented by an antisymmetrized many-body wave function consisting of single-particle states which are localized in phase space. The equations of motion for the parameters characterizing the many-body state (e.g. positions, momenta and spins of the particles) are derived from a quantum variational principle. This contribution gives first results for ground states of nuclei and collisions between light nuclei. (orig.).

Successive deviation of expression for the amplitude of $\gamma$d->pn (ed->e'pn), reaction in terms of Bethe-Salpeter (BS) amplitudes for initial and final states and electromagnetic Mandelstam current is suggested. It is shown that in BS formalism the SO called S-pole diagram, corresponding to intermediate deuteron, is the consequence of pole part separation in t-matrix of NN-scattering, satisfying BS equation.

**35310** (LA-UR–91-2922) **P-d capture reactions in muonic molecules.** Friar, J.L. Los Alamos National Lab., NM (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9109122—2: 13. European conference on few-body problems in physics, Elba (Italy), 9-14 Sep 1991). Order Number DE92000256. Source: OSTI; NTIS; INIS; GPO Dep.

Capture reactions for very low-energy n-d and p-d systems are calculated and compared with experiment, as are low-energy n-d and p-d scattering. We find excellent agreement for the n-d scattering lengths, but poor agreement for the p-d case, which we believe is a problem with the experimental extrapolation. The n-d radiative capture is sensitive to details of the meson-exchange currents, but reasonable models agree with the data. The latter models are in good agreement with experiment when extended to the p-d case. Our large quartet capture rate resolves a long-standing anomaly. The EO capture matrix element recently obtained from a reanalysis of internal conversion in muonic molecules is in excellent agreement with our predictions. This matrix element is very clean theoretically and provides the best test of the calculations. 33 refs., 3 figs., 1 tab.

**35311** (LA-UR–91-2988) **Unitarity and pion production in relativistic heavy-ion collisions.** Liu, L.C. Los Alamos National Lab., NM (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9106194–7: International workshop on pions in nuclei, Penyscola (Spain), 2-9 Jun 1991). Order Number DE92000212. Source: OSTI; NTIS; INIS; GPO Dep.

Pion production in relativistic heavy-ion collisions is examined. It is shown that the commonly employed effective-velocity theory is incorrect. A formulation based on the unitarity is presented. 8 refs., 1 figs.

**35312** (SAND–91-2113C) **Neutron interactions and contrast production in neutron radiography.** McCrory, F.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-910952–1: Fall conference and 50th anniversary conference of the American Society for Nondestructive Testing, Boston, MA (United States), 15-18 Sep 1991). Order Number DE91019064. Source: OSTI; NTIS; INIS; GPO Dep.

The usefulness of neutron radiography as a nondestructive engineering tool is heavily dependent on how a neutron reaches the image plane. Neutron interactions such as scattering and absorption, within a neutron radiography facility or a test part, affect the contrast of the resulting image generated by the process. It is important that the radiographer has a general understanding of how neutrons interact with matter to produce a quality image utilizing a neutron beam. 4 refs.

This report discusses radiative transfer model development in support of the ARM program. (LSP)

**35314** (EGG–1183-1432) **Selected HENRE measurements.** Jobst, J.E. EG and G, Inc., Las Vegas, NV (United States). 18 Apr 1969. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-76NV01183. Order Number DE91018217. Source: OSTI; NTIS; GPO Dep.

The acronym "HENRE" stands for high energy neutron reactions experiments. HENRE is a neutron generator operated by EG&G for the Civil Effects Branch, Division of Biology and Medicine, of the AEC. It is located on the Nevada Test Site, approximately 85 miles northwest of Las Vegas. HENRE is basically a linear accelerator mounted on a tower. The Civil Effects Test Operations (CETO) of

the Division of Biology and Medicine (DBM) of the US Atomic Energy Commission has operated HENRE on the Nevada Test Site for the past three years. This document provides a very brief summary of the data acquired in a large variety of field experiments. 9 figs.

**35315** (IAEA-TECDOC–572, pp. 133-137) **The role of the REAL-88 exercise in the radiation damage characterization of nuclear facilities.** Zsolnay, E.M. (Netherlands Energy Research Foundation, Petten (Netherlands)); Nolthenius, H.J.; Szondi, E.J. International Atomic Energy Agency, Vienna (Austria). Oct 1990. (CONF-8909234–: Advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna (Austria), 19-22 Sep 1989). In *Nuclear data for radiation damage assessment and related safety aspects 1989: Proceedings of an advisory group meeting held in Vienna, 19-22 September 1989.* 193p. Order Number DE92601383. Source: OSTI; NTIS (US Sales Only); INIS.

In the frame of the REAL-88 project a reference file will be produced for neutron metrology use containing the best available input-output information for 6 typical neutron spectrum cases, furthermore, cross section processing codes and several utility programs. A number of reactions cannot be incorporated because no adequate cross section data are available. Discrepant cross section values, furthermore, clearly imperfect cross section uncertainty data were found in the IRDF-85 for several reactions. (author). 13 refs.

**35316** (IAEA-TECDOC–572, pp. 139-144) **Physically based weighting spectrum generation for cross section calculations.** Szondi, E.J. (Technical Univ. of Budapest (Hungary). Inst. of Nuclear Techniques); Bosznay, A.P. International Atomic Energy Agency, Vienna (Austria). Oct 1990. (CONF-8909234–: Advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna (Austria), 19-22 Sep 1989). In *Nuclear data for radiation damage assessment and related safety aspects 1989: Proceedings of an advisory group meeting held in Vienna, 19-22 September 1989.* 193p. Order Number DE92601383. Source: OSTI; NTIS (US Sales Only); INIS.

For collapsing the cross section data into a coarse group structure one needs a continuous weighting neutron spectrum. This spectrum is known in the coarse structure. The newly developed procedure for converting the spectrum into the 640 group SAND II structure takes into account the few-group spectrum, a semi-analytically described model spectrum and the user's experience. The IBM PC/AT program "BLOW UP" will be distributed by the IAEA NDS among the utility programs of the REAL-88 neutron spectrum adjustment reference file. (author). 9 refs, 3 figs.

**35317** (LA–12196) **MCNP: Photon benchmark problems.** Whalen, D.J.; Hollowell, D.E.; Hendricks, J.S. Los Alamos National Lab., NM (United States). Sep 1991. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92000694. Source: OSTI; NTIS; INIS; GPO Dep.

The recent widespread, markedly increased use of radiation transport codes has produced greater user and institutional demand for assurance that such codes give correct results. Responding to these pressing requirements for code validation, the general purpose Monte Carlo transport code MCNP has been tested on six different photon problem families. MCNP was used to simulate these six sets numerically. Results for each were compared to the set's analytical or experimental data. MCNP successfully predicted the analytical or experimental results of all six families within the statistical uncertainty inherent in the Monte Carlo method. From this we conclude that MCNP can accurately model a broad spectrum of photon transport problems. 8 refs., 30 figs., 5 tabs.

In 1988 the Department of Energy became the first Federal agency to adopt the Presidential Guidance prepared by the Environmental Protection Agency, which incorporated the recommendations of the International Commission on Radiological Protection published in 1977. The most important provisions adopted are discussed in this paper. Two controversial issues are also discussed. Problem areas which gave rise to proposed revisions are explained.

**35320** (CONF-910137–, pp. 24-31) **Rethinking basic concepts in ICRP's system of dose limitation.** Mills, W.A. (Oak Ridge Associated Universities, Washington DC (USA)); Mossman, K.L. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The present criterion for radiation protection appears to be exposure reduction rather than adequate protection of health. The 1990 ICRP draft recommendations for a system of dose limitation would further implement this more restrictive criterion by implementing certain academic concepts and assumptions. These concepts and assumptions are discussed and the suggestion is made that the radiation protection community needs to carefully examine the need for the complex system proposed.

**35321** (CONF-910137–, pp. 32) **NCRP and ICRP - What's happening?.** Meinhold, C.B. (Brookhaven National Lab., Upton, NY (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. DOE Contract AC02-76CH00016. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

As a result of the 1986 data from the Japanese life span study UNSCEAR (1989) and the NAS BEIR (1990) performed an in-depth analysis of all the current information on risks to man from ionizing radiation. Acting on the same preliminary information, NCRP made a number of suggestions reflecting the possible change in risk estimates in its NCRP 91 (1987). ICRP began a review of its Publication 26 (1977) and concluded that a revision would be needed. Both ICRP and NCRP set up task groups to provide evaluations of the available risk information as it might apply to radiation protection. Both risk committees have concluded their work and the results are quite similar. The ICRP's revisions to its basic recommendations are virtually complete and should be available shortly. Since the NCRP considered this data in its 1987 reports, substantial changes are not likely in its recommendations on limits.

**35322** (CONF-910137–, pp. 55-62) **Benefits of the effective dose equivalent concept at a medical center.** Vetter, R.J. (Mayo/Clinic Foundation, Rochester, MN (USA)); Classic, K.L. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

A primary objective of the recommendations of the International Committee on Radiological Protection Publication 26 is to insure that no source of radiation exposure is unjustified in relation to its

benefits. This objective is consistent with goals of the Radiation Safety Committee and Institutional Review Board at medical centers where research may involve radiation exposure of human subjects. The effective dose equivalent concept facilitates evaluation of risk by those who have little or no knowledge of quantities or biological effects of radiation. This paper presents effective dose equivalent data used by radiation workers and those who evaluate human research protocols as these data relate to personal dosimeter reading, entrance skin exposure, and target organ dose. The benefits of using effective dose equivalent to evaluate risk of medical radiation environments and research protocols are also described.

**35323** (CONF-910137–, pp. 81-94) **UK experience with ICRP26 and ICRP30.** Dray, C.H. (NE America, Monmouth Junction, NJ (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

ICRP26 was adopted in January 1977 which took into account information emerging since the adoption of ICRP9 in September 1969 and specified the basic criteria for dose limitation which still apply today. ICRP30 defines the limits for intakes for radionuclides for workers, and enables the health physicist and regulatory bodies to make appropriate limits for annual intake, air contamination etc, to comply requirements of dose-equivalent commitment and committed dose equivalent. The publication of ICRP26 is reflected in European Communities directive 80/836/Euratom. Council Directive of 15th July 1980 amending the Directive laying down the basic safety standards for the health protection of general public and workers against the dangers of ionizing radiations. This document being required the member states to bring the requirements of the directive within their legislation. In the United Kingdom this was accomplished by the publication of the Ionizing Radiations Regulations 1985.

**35324** (CONF-910137–, pp. 95-103) **Deficiencies in radiation protection record systems.** Martin, J.B. (Pacific Northwest Lab., Richland, WA (USA)); Lyon, M. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. DOE Contract AC06-76RL01830. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

Radiation protection records are a fundamental part of any program for protecting radiation workers. Records are essential to epidemiological studies of radiation workers and are becoming increasingly important as the number of radiation exposure litigation cases increases. Ready retrievability of comprehensive records is also essential to the adequate defense of a radiation protection program. Appraisals of numerous radiation protection programs have revealed that few record-keeping systems comply with American National Standards Institute, Standard Practice N13.6-1972. Record-keeping requirements and types of deficiencies in radiation protection records systems are presented in this paper, followed by general recommendations for implementing a comprehensive radiation protection records system.

**35325** (CONF-910137–, pp. 2-16) **Overview of the revised 10 CFR Part 20, standards for protection against radiation.** Peterson, H.T. (Nuclear Regulatory Commission, Washington DC (USA)); Cool, D.A.; Buchanan, J.D.; Cool, W.S. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The revised 10 CFR Part 20 is based upon the 1977 recommendations of the International Commission of Radiological Protection and is generally consistent with the 1987 recommendations of the National Council on Radiation Protection and Measurements. The revised Part 20 contains significant changes from past practice and procedures for estimating, measuring, combining, recording and reporting doses. These changes are associated with the introduction of new concepts and methods of assessing doses.

**35326** (CONF-910137–, pp. 104-108) **NVLAP and DOELAP dosimetry accreditation programs.** Loesch, R.M. (Dept. of Energy, Washington, DC (USA)); Gladhill, R.L.; McDonald, J.C.; Carlson, R.D. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. There are two programs that are operated by US Government agencies for the accreditation of personnel dosimetry processors. They are the National Voluntary Laboratory Accreditation Program (NVLAP) and the Department of Energy Laboratory Accreditation Program (DOELAP). These two programs exhibit many similarities, but there are some notable differences. Both have been in operation for a number of years, and this paper will discuss their experiences to date and plans for their future development.

**35327** (CONF-910137–, pp. 110-113) **Teledosimetry in a spent fuel pool.** Desrosiers, A.E. (Bartlett Nuclear, Inc., Plymouth, MA (USA)); Moyles, M. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

Recently, the USNRC reemphasized the regulations concerning the definition of whole body dose. Specifically, the dose to the ankle is included in whole body dose. When the radiation field gradient is very strong and the dose rates are very high, monitoring the dose to the ankle is a special challenge. In order to adequately protect drivers in a spent fuel pool, the authors develop a program that is a marked departure from the concepts of prejob surveys and staytimes. They decided to directly instrument five major points of the whole body and use telemetry and individual local alarms to control radiation dose. In this paper they explain this concept and extrapolate to similar situations.

**35328** (CONF-910137–, pp. 119-126) **Is the ICRP-26 weighting factor for gonadal dose appropriate for new federal regulations?.** Drum, D.E. (Brigham and Women's Hospital and Harvard Medical School, Boston, MA (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

In 1977 the ICRP recommended that computation of the occupational whole body effective dose equivalent include individual organ dose weighting factors derived from risk coefficients for stochastic effects. The-preeminent weighting factor of 0.25 was assigned to irradiation of the gonads in order to account for heritable genetic effects manifest in later generations. As of 1990, there exists no positive significant evidence for the occurrence of transmitted genetic effects in humans after radiation of any form, dose, or dose rate. To assign to gonads 25% of the health detriment from radiation has no basis in medical experience. It establishes a policy that may underestimate the proportion of real mortality from other more radiosensitive organs, and the policy could compromise unreasonably the occupational stability of workers whose activities may involve gonadal irradiation.

**35329** (CONF-910137–, pp. 164) **ALARA for the practical person.** Kathren, R.L. (Hanford Environmental Health Foundation, Richland, WA (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The increasing significance of ALARA in recent years has spawned numerous articles and complex technological means to achieve as low as reasonably achievable. The available body of literature on ALARA has grown so large and complex that it is an overwhelming and virtually impossible task for a single individual to remain abreast of it. Regulatory requirements and interpretations of ALARA further add to the difficulties of the operational radiation protection staff seeking ALARA. The practical person can, however, promote and provide ALARA by recalling and applying certain simple principles, including the following, which will be discussed in depth: (1) ALARA is basic and fundamental to any program of radiological protection, and as such the ALARA program or practices must be specifically identifiable. (2) ALARA is a never ending quest, and much like the speed of light or halving the distance to the goal, can really never be reached in a theoretical sense. (3) ALARA is not necessarily synonymous with dose reduction, and certainly does not involve ever continuous reduction in dose. (4) There is no single monetary value applicable to a unit of dose; rather each incremental unit of dose must be examined in the total context of the exposure situation. (5) ALARA involves professional opinion and judgment; responsible and qualified professional health physicists may differ in their opinions as to what constitutes ALARA.

**35330** (CONF-910137–, pp. 196-203) **New influences on the ALARA concept.** Alexander, R.E. (The Alexander Corp., Fairfax, VA (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The ALARA concept is an essential component of an occupational radiation protection program because the fatality risk associated with continued exposure at or near the 5-rems/year limit is unacceptably high. Using a risk coefficient of $4 \times 10^{-4}$ fatalities/person-rem the risk for a large worker population exposed in this manner for a working lifetime would be 10%. The ICRP fatality risk criterion is an average of 1 per year per 10 thousand workers. The average annual dose that would achieve this objective depends on the risk coefficient used. Using $4 \times 10^{-4}$ again, the annual dose average would have to be 0.25 rem, a factor of 20 below the limit. It is evident that the ALARA concept is the most important aspect of occupational radiation protection and that the justification for an effective ALARA program is the cancer fatality risk. Not quite so evident but nonetheless important is the consideration that once the ICRP criterion is achieved, it is probably int eh best interest of the workforce to use resources available for their health and safety to reduce other risks. In this paper the risk information under examination by the government agencies is reviewed from the viewpoint of dose reduction through enhanced implementation of the occupational ALARA concept.

**35331** (CONF-910137–, pp. 214-215) **The legal aspects of fetal protection policies in the workplace.** Jose, D.E. (Pepper, Hamilton, and Scheetz, Philadelphia, PA (USA)); Scott, E.K. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The concerns of working women have received increasing attention from lawmakers, employers and women themselves as more and more American women enter the workforce. Fetal protection policies evidence a growing awareness by employers that their workplace poses special hazards to the unborn children of women workers. Yet, the fetal protection area is fraught with tension between legitimate competing concerns. Women expect equal employment opportunities, and employers are legally bound to provide equal treatment; however, these interests are challenged by women's desire to deliver healthy babies and employers' desire to avoid causing fetal defects or to be sued for naturally occurring genetic defects. Title 7 of the Civil Rights Act of 1964 and various state laws on fair employment practice embodies societal concerns for fairness in employment as it relates to fetal protection. Fetal protection policies are one example in which discriminatory practices are implicated since under such policies employers may refuse to hire or segregate previously hired pregnant women or women of child bearing age on the grounds that such exclusion or segregation is necessary to protect fetal health or the reproductive capacity of the female employee. A dilemma is presented to the employer of any nuclear workforce which includes women since the permissible dose for a man or woman is many times larger than the dose for a fetus.

**35332** (CONF-910137–, pp. 216) **Mathematical phantoms and specific absorbed fractions for the adult female at three, six, and nine months of pregnancy.** Watson, E. (Oak Ridge Associated Univ., TN (USA)); Stabin, M.; Eckerman, K.; Cristy, M.; Ryman, J.; Davis, J.; Marshall, D. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

Estimation of radiation dose requires information on the absorbed fractions of energy for organs and tissues of the body. The Snyder-Fisher phantom, developed at Oak Ridge National Laboratory (ORNL) to represent a 70 kg adult, has been widely used to compute absorbed fractions. A series of phantoms, also developed at ORNL, represent individuals of various ages from newborns to adults, and are used in estimation of tissue dose for radiation workers, members of the general public, and nuclear medicine patients. Because of its size (56 kg), the 15-year-old phantom from this series has also been used to represent the average adult female. We have adapted this model for the adult female and have incorporated anatomical changes which occur during pregnancy. The size and composition of the fetus as a function of gestational age, the position and shape of the various abdominal organs, and the nature of magnitude of other changes which occur in the body during pregnancy (e.g. the spreading of the pelvic bones) were determined from the literature. Models for three, six, and nine months gestation were developed by incorporating the appropriate changes into the adult female phantom. The model was implemented in the ALGAMP Monte Carlo codes at ORNL to calculate the absorption of radiation within the phantom from internal sources of radiation. The results of these calculations will be presented, along with a description of the models and assumptions used in the simulations.

**35333** (CONF-910137–, pp. 217) **The informed radiation worker and fetal dose policies.** Harshaw, F.B. (Columbia Univ., New York, NY (USA)). Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

The role of women in a workplace in which radioactive materials and radiation producing equipment are used has never been more controversial than it is now. So important, in fact, has this become that the Supreme Court has decided to hear a case that will have major implication not only for female radiation worker but for all employers and certainly for all health physicist involved in attempting to set a reasonable policy for the female worker and her potential for pregnancy. In this paper, a review of the recent BEIR V information and the UNSCEAR data will be made as well as a review of fetal development. Also, the ALARA requirements will be reviewed. Finally, risk perception will be discussed.

**35334** (CONF-910137–, pp. 242-247) **University/Hospital fetal dose policy experiences.** Wilson, B.M. (Univ. of North Carolina, Chapel Hill (USA)); Vinson, W.R.; Deforest, W.W.; Washburn, D.B. Health Physics Society, NC (United States). North Carolina Chapter. [1991]. From 24. midyear topical meeting of the Health Physics Society; Raleigh, NC (United States); 20-25 Jan 1991. In *Implementation of current NCRP and ICRP guidance and revised 10 CFR Part 20: Proceedings.* 257p. Order Number DE91016184. Source: OSTI; NTIS; INIS.

Since at least 1981, an informal policy has existed at the authors research university and teaching hospital institution to interview, inform and assure appropriate personnel monitoring for pregnant radiation workers. Events, such as popular and technical publications (NCRP 87) and the maturation of NRC's proposed changes in 10 CFR 20 (NRC 88), brought increased attention to the subject of fetal radiation dose. The need for a formal approach to the subject became evident. By 1987, a concerted effort to promulgate a formal policy was launched. A draft policy statement was presented to each institutional radiation safety committee for review and action. There was immediate strong interest. A thorough, multilevel review, comment and redraft process developed. Well tested policy statements were then approved in 1988.

**35335** (INIS-mf–12958, pp. 18-34) **Dosimetry quality assurance in the U.S. from the experience of the Radiological Physics Center.** Hanson, W.F. (Texas Univ., Houston, TX (USA). For more than two decades, the Radiological Physics Center (RPC), has monitored radiation therapy dosimetry at those institutions participating in cooperative clinical trails funded by the U.S. National Cancer Institute (and recently by the National Eye Institute). There has been a significant improvement in external beam calibration over that time. A mailed TLD program has been implemented that monitors machine calibration for photon and electron beams, and energy of electron beams. This is an effective screening mechanism for identifying potential problems at the participating institutions. Review of patient treatment records by the RPC is shown to improve the accuracy of dosimetry in radiotherapy, and thus has a significant benefit to the reliability of radiation data for clinical trials. 23 refs, 6 figs, 11 tabs.

**35336** (INIS-mf–12958, pp. 35-54) **New practice for the calibration of radiotherapy dosimeters.** Jaervinen, H. (SSDL, Helsinki (Finland)). International Atomic Energy Agency, Vienna (Austria). Hard copies are available from IAEA Division of Life Sciences, Dosimetry Section.

As a result of the new international recommendation for radiotherapy dosimetry, the standard dosimetry laboratory has applied of the Finnish Centre for Radiation and Nuclear Safety has applied the following practice for the calibration of radiotherapy dosimeters from January 1, 1989: (i) The calibration is carried out with a $^{60}Co$ gamma radiation beam; (ii) To calculated the calibration factor N for cylindrical chambers, the values of the necessary parameters are taken from the recommendation by the IAEA. Two new parameters are used, correction factors $P_{cel}$ and $P_{eff}$; (iii) To calculated the calibration factor N for parallel plate chambers (only for electron radiation), the values of stopping-power ratio $(s_{w,air})_u$, perturbation correction factor $P_u$ and the correction factor for parallel plate chamber $k_{pp}$ are still taken from the recommendation by the Nordic Association of Clinical Physics. The values of all parameters used for the calculation of calibration factor N are given as an Appendix. 3 refs.

**35337** (INIS-mf–12958, pp. 55-57) **Absorbed dose intercomparison studies for Co-60 therapy units by the SSDL, Istanbul, Turkey.** Yasar, S. (Cekmece Nuclear Research and Training Centre, Istanbul (Turkey). Dosimetry Lab.); Kiyak, N.; Turer, A.; Alkan, H. International Atomic Energy Agency, Vienna (Austria). Div. of Life Sciences; World Health Organization, Geneva (Switzerland). Apr 1991. 59p. In *SSDL Newsletter. No. 30.* Order Number DE92601235. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available from IAEA Division of Life Sciences, Dosimetry Section.

In 1989, CNAEM Secondary Standard Dosimetry Laboratory (SSDL) undertook a TLD intercomparison programme using the IAEA/WHO method for the user of Co-60 teletherapy units to raise the dosimetric accuracy in radiotherapy. For this purpose, the radiotherapy centres in Turkey are sent plastic capsules containing LiF by post and are asked to irradiate these capsules to an absorbed dose of 2.0 Gy at a depth of 5 cm in water. The irradiated TLD capsules are returned to the SSDL by the radiotherapy centres. The given dose to the capsule is determined by SSDL and this measured dose is compared with stated dose by the radiotherapy centre. In this intercomparison were found that the 9 radiotherapy centres have less than +-5% deviation and 3 radiotherapy centres have higher than +-5% deviation. 6 refs, 1 tab.

**35338** (KURRI-TR–347) **Proceedings of the conference on health physics: Future development of health physics.** Tsujimoto, Tadashi; Mizuma, Mitsuo (eds.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1991. 35p. (In Japanese). (CONF-9003295–: Conference on health physics, Kumatori (Japan), 20 Mar 1990). Order Number DE92704335. Source: OSTI; NTIS (US Sales Only); INIS.

This booklet presents nine talks given at the Conference on Health Physics, which was held on March 20, 1990, at Research Reactor Institute of Kyoto University (KURRI), Japan. The first talk discusses future trends in health physics, focusing on the application of computers, development of new techniques, energy industries, and administrative regulations. The second talk discusses the importance of health physics in relation to nuclear energy. The third one addresses importance of health physics in relation to medical treatment. The fourth and fifth ones discuss the present status and future trends in education in health physics. The sixth one focuses on education in health physics, placing emphasis on grass-roots activities in this field. The seventh and eighth talks discusses various activities to be carried out in the future by the Health Physics Research Center. The ninth one describes major developments leading to the establishment of the Health Physics Research Center. Three appendices are attached which respectively summarizes major subjects at a meeting on the budget for the Health Physics Research Center, outlines some studies for radiation control in space aircraft and space bases, and describes major reasons for the necessity of the Health Physics Research Center. (N.K.).

**35339** (NIRS-M–78, pp. 247-255) **Revision of the ICRP dosimetric model for the human respiratory tract.** Bair, W.J. (Pacific Northwest Lab., Richland, WA (USA)). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1991. (CONF-891290–: 21. annual NIRS symposium on inhalation of airborne particles and induction mechanisms, Chiba (Japan), 7-9 Dec 1989). In *Inhalation of airborne particles and mechanisms for induction of biological effects.* 271p. Order Number DE91508518. Source: OSTI; NTIS (US Sales Only); INIS.

Although the dosimetric model of the respiratory tract used in ICRP Publication 30 had not been shown to be seriously deficient for the purpose of calculating Annual Limits on Intake (ALIs) for workers, the availability of new information led the ICRP in 1984 to create a special Task Group to review the dosimetric model of the respiratory tract and, if justified, propose revisions or a new model. The Task Group directed its efforts towards improving the model used in Publication 30 rather than developing a new model. The objective was a model that would: Facilitate calculation of biologically meaningful doses; be consistent with morphological, physiological, and radiobiological characteristics of the respiratory tract; incorporate current knowledge; meet all radiation protection needs; be user friendly by not being unnecessarily sophisticated; be adaptable to development of computer software for calculation of relevant radiation doses from knowledge of a few readily measured exposure parameters; be equally useful for assessment purposes as for calculating ALIs; be applicable to all members of the world population; and consider the influence of smoking, air pollutants, and diseases of the inhalation, deposition, and clearance of radioactive particles from the respiratory tract. Rather than calculating an average dose to the total lungs, emphasis was given to calculating doses to tissues and cells of most concern, those that had shown evidence of susceptibility to radiation induced cancers either in humans or in experimental animals. Since both the radiation dose and the cancer susceptibility of each region determine the overall risk to the respiratory tract of a given radionuclide

intake, the model provides for calculation of a committed dose equivalent for each region, adjusted for the relative cancer sensitivity of that region, and for the summing of these to yield a committed dose equivalent for the entire respiratory tract. J.P.N.

International Atomic Energy Agency, Vienna (Austria). Oct 1990. (CONF-8909234–: Advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna (Austria), 19-22 Sep 1989). In *Nuclear data for radiation damage assessment and related safety aspects 1989: Proceedings of an advisory group meeting held in Vienna, 19-22 September 1989.* 193p. Order Number DE92601383. Source: OSTI; NTIS (US Sales Only); INIS.

A theoretical model of evaluation of radiation effects in solid matter is presented. At low radiation exposures changes in the atomic densities of the atoms in the media can be neglected and the equations become linear and are solved analytically. As an example damage production rates in $^{56}Fe$ were calculated in the energy range 7.0 to 40 MeV. (author). 5 refs, 4 figs, 1 tab.

A possibility of new collective effects for the system of Moessbauer nuclei in the external constant field, which is electric one for nuclear E1-transitions and magnetic for M1 ones is shown. Nucleus interaction by means of gamma-quantum exchange in the presence of such an external field, supplementing the variable resonance field, leads to the occurrence of coherent state in which transition dipoles are arranged along the external constant field. As a result of this coherent radiation occurs, internal conversion coefficient is reduced, and the Moessbauer absorption cross section and area under the resonance spectrum are increased. 10 refs.

**35348** (KEK-PR–90-2) **KENS report-8, 1989/90.** Ikeda, H.; Furusaka, M.; Watanabe, N. (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). 1991. 292p. Order Number DE92704329. Source: OSTI; NTIS (US Sales Only); INIS.

In this report, the research progress at the KENS facility during the period from April, 1988 to September, 1990 is summarized. In this period, proton beam intensity was gradually increased, and in March, 1989, the proton beam intensity of $2 \times 10^{12}$ protons per pulse corresponding to 6.7 $\mu$A in time-averaged beam current at 20 Hz was successfully achieved with the 500 MeV booster synchrotron.

During this period, efforts were exerted to maintain research activities with very modest proton beam intensity in KENS. A program to improve the performance of all instruments by about ten times in intensity equivalence (data rate, resolution, signal to background ratio and so on). In some instruments, the improvement has already been achieved, while in the remainder, it is still in progress. At the same time, a program to build up and promote better science was started. About ten workshops a year of small size are organized on various fields of research using pulsed neutrons. The progress in KENS, the summary of booster synchrotron operation, the instruments in KENS, the scientific reports on neutron scattering, instrumentations and the development for future program and Japan-UK collaboration on neutron scattering are reported. (K.I.).

**35349** (LA-UR-91-2951) **Derivation of the high field semiconductor equations.** Hagan, P.S. (Los Alamos National Lab., NM (United States)); Cox, R.W.; Wagner, B.A. Los Alamos National Lab., NM (United States). [1991]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9107176--1: 1991 IMA semiconductor workshop, Minneapolis, MN (United States), 15 Jul - 9 aug 1991). Order Number DE92000249. Source: OSTI; NTIS; GPO Dep.

Electron and hole densities evolve in x-z phase space according to Boltzmann equations. When the mean free path of the particles is short and electric force on the particles is weak, a well-known expansion can be used to solve the Boltzmann equation. This asymptotic solution shows that the spatial density of electrons and holes evolves according to diffusion-drift equations. As devices become smaller, electric fields become stronger, which renders the Basic Semiconductor Equations increasingly inaccurate. To remedy this problem, we use singular perturbation techniques to obtain a new asymptotic expansion for the Boltzmann equation. Like the Hilbert expansion, the new expansion requires the mean free path to be short compared to all macroscopic length scales. However, it does not require the electric forces to be weak. The new expansion shows that spatial densities obey diffusion-drift equations as before, but the diffusivity D and mobility $\mu$ turn out to be nonlinear functions of the electric field. In particular, our analysis determines the field-dependent mobilities $\mu(E)$ and diffusivities D(E) directly from the scattering operator. By carrying out this asymptotic expansion to higher order, we obtain the high frequency corrections to the drift velocity and diffusivity, and also the corrections due to gradients in the electric field. Remarkably, we find that Einsteins's relation is still satisfied, even with these corrections. The new diffusion-drift equations, together with Poissons' equation for the electric field, form the high-field semiconductor equations, which can be expected to be accurate regardless of the strength of the electric fields within the semiconductor. In addition, our analysis determines the entire momentum distribution of the particles, so we derive a very accurate first moment model for semi-conductors by substituting the asymptotically-correct distribution back into the Boltzmann equation and taking moments.

**35350** (LA-UR-91-2968) **Neutron Brillouin scattering in a metallic glass.** Suck, J.B. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Nukleare Festkoerperphysik); Egelstaff, P.A.; Robinson, R.A.; Sivia, D.S.; Taylor, A.D. Los Alamos National Lab., NM (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9109103--1: 5. international conference on the structure of non-crystalline materials, Sendai (Japan), 2-6 Sep 1991). Order Number DE92000219. Source: OSTI; NTIS; GPO Dep.

The dispersion of collective modes in a metallic glass ($Mg_{70}Zn_{30}$) measured earlier at the thermal neutron time-of-flight spectrometer IN4 of the HFR of the ILL could be extended towards lower momentum transfers down to the first pseudo-Brillouin zone for the first time. This extension to momentum transfer not accessible up to now was possible using the highly resolving time-of-flight spectrometer HET of the new spallation source ISIS. In the region of overlap the two parts of the dispersion determined with different samples of the same metallic glass on different instruments agree very well. Also the earlier discrepancies with the dispersion determined for this metallic glass from a computer simulation could be nearly completely eliminated due to a more recent and more complete investigations of this glass.

**35351** (LA-UR-91-3135) **Lagrangian analysis, data covariance, and the impulse time integral.** Forest, C.A. Los Alamos National Lab., NM (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9107105--52: 1991 American Physical Society (APS) conference on shock compression of condensed matter, Williamsburg, VA (United States), 17-20 Jul 1991). Order Number DE92000169. Source: OSTI; NTIS; GPO Dep.

Lagrangian analysis is mathematical analysis of data derived from flow experiments in which embedded gauges move with the material motion (constant Lagrangian mass-point coordinate). With sufficient data, the conservation laws of mass, momentum, and energy are applied to the data in order to construct flow-variable fields, of particle velocity, stress, density, et cetera. Toward this end, a new Lagrangian analysis method has been constructed, that is centered upon a function, $\alpha$, that incorporates conservation of mass and momentum into its definition. Further, the existence of $\alpha$ allows simultaneous, consistent, least-squares fitting of surfaces to all of the flow data. The method also incorporates a novel treatment of the data covariance effects resulting from gauge-to-gauge calibration uncertainty. Analysis of a synthetic data set illustrates the method. 8 refs., 8 figs.

**35352** (NIFS-85) **Dependence of $Au^-$ production upon the target work function in a plasma-sputter-type negative ion source.** Okabe, Yushirou; Sasao, Mamiko; Fujita, Junji; Yamaoka, Hitoshi; Wada, Motoi. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 32p. Order Number DE92713936. Source: OSTI; NTIS (US Sales Only); INIS.

A method to measure the work function of the target surface in a plasma-sputter-type negative ion source has been developed. The present method can be used to determine the work function by measuring the photoelectric current induced by two lasers (He-Ne, $Ar^+$ laser). The dependence of $Au^-$ production upon the work function of the target surface in the ion source was studied using this method. The time variation of the target work function and $Au^-$ production rate were measured during the cesium coverage decrease due to the plasma ion sputtering. The observed minimum work function of a cesiated gold surface in an Ar plasma was 1.3 eV where the negative ion production rate ($Au^-$ current/target current) took the maximum value. The negative ion production rate showed the same dependence on the incident ion energy as that of the sputtering rate when the work function was constant. (author).

**35353** (NIFS-88) **High resolution spectroscopy of $H^+$ energy loss in thin carbon film.** Matsunami, Noriaki (Nagoya Univ. (Japan). Faculty of Engineering); Kitoh, Kenshin. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 22p. Order Number DE92713939. Source: OSTI; NTIS (US Sales Only); INIS.

The energy loss of $\approx$100 keV $H^+$ transmitted through thin carbon film of $\approx$7 nm has been measured with the resolution of $\approx$20 eV. We have observed new energy loss peaks around 210 and 400 eV in addition to the normal energy loss peak around 1 keV. We find that the experimental artifacts, ionization of C K-(290 eV) and impurity inner-shells, extreme non-uniformity of films, events associated with elastic scattering are not responsible for these peaks. The origin of these low energy loss peaks will be discussed. (author).

**35354** (NIFS-PROC-5, pp. 35-44) **Study on ablation of target material induced by pulsed ion beam bombardment.** Kamihata, S. (Kobe Univ. of Mercantile Marine (Japan)); Kitamura, A.; Furuyama, Y.; Nakajima, T. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

Process of ablation due to irradiation of medium power pulsed ion beams (PIB) with a power level of $10^7$-$10^8$ W/cm$^2$, which have been proved useful for material processing, is investigated with use of a charge collector method and a 'collector-RBS method'. In the letter, the ablation particles are collected onto a silicon probe surface, which is later subjected to Rutherford Backscattering Spectroscopy (RBS). Preliminary results of measurements on the ablation mass as a function of the ion current density and the

target material and on the ion energy include some interesting features, which must be followed by further investigation. (author).

**35355** (SAND–91-1861C) **Charge states of donor-hydrogen pairs in Si: A fragile balance.** Estreicher, S.K. (Texas Tech Univ., Lubbock, TX (United States). Dept. of Physics); Seager, C.H.; Anderson, R.A. Sandia National Labs., Albuquerque, NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9107146–3: 16. international conference on defects in semiconductors, Bethlehem, PA (United States), 22-26 Jul 1991). Order Number DE91018794. Source: OSTI; NTIS; GPO Dep.

The debonding rates of H-passivated P and As in silicon have been observed to be very sensitive to the concentration of majority and minority charge carriers. A theoretical study of the stable and metastable configurations of the {P,H} and {As,H} pairs in the 0 and +1 charge states has been carried out at the near-ab-initio Hartree-Fock level. These calculations show that the lowest-energy configuration in the 0 charge state is the highest-energy configuration in the +1 charge state and vice-versa. This bistability of donor-hydrogen pairs implies that H cannot remain in place upon change of charge state, whether $0 \rightarrow +1$ or $+1 \rightarrow 0$. Quantitative differences between the P and the As cases are qualitatively consistent with the observed differences in the temperature dependence of the debonding rates of {P,H} and {As,H}. 14 refs., 1 fig.

**35356** (UCRL-JC–106887) **Stray light implications of scratch/dig specifications.** Lewis, I.T. (Lawrence Livermore National Lab., CA (United States)); Ledebuhr, A.G.; Bernt, M.L. Lawrence Livermore National Lab., CA (United States). 22 Jul 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9107115–47: Society of Photo-Optical Instrumentation Engineers (SPIE) meeting, San Diego, CA (United States), 21-26 Jul 1991). Order Number DE91018461. Source: OSTI; NTIS; GPO Dep.

The bidirectional transmittance distribution function (BTDF) of two sets of scratch/dig standard sets were measured. These sets were representative of the inspection standards used in the optical industry to characterize polished surface defects. Measurements were taken with a small (1 mm diameter) illumination beam to maximize signal. The increase in average BTDF that results from a single scratch or dig over the MIL-STD 20 mm diameter surface was then calculated to determine what overall impact a defect will have on system stray light above base surface scattering due to surface micro-roughness. A BTDF measurement was taken with the illumination beam centered on the defect, then with it centered on a smooth section of the reference sample to find the increase in scattering caused by the defect. Results show that dig scattering, when normalized to account for the single dig per 20 mm MIL-STD inspection area criteria, did not catastrophically increase the 0.05 $B_0$ ($B_0$ is the BTDF at 0.57°) at 633 nm characteristic of a high quality optical surface. As intuitively expected, dig scattering was angularly symmetric. Scratches, however, scattered highly directionally. Normalized BTDF is substantially increased from a smooth surface's typical 0.05 $B_0$ perpendicular to the scratch axis, but is unaffected in other angles. On average, the scratches may not have increased net surface scattering. Scattering from the defects on the surfaces below the 40-20 scratch/dig level was found to not cause a catastrophic increase in scattering over the level os a well-polished optic (typically 4Å rms roughness). Since comparisons with scratch/dig samples only serve to provide a measure of the localized defects, and fail to be useful in determining the low-level scattering from the surface microroughness, one should not assume that a "40-20" surface is necessarily a low-scattering optic. 6 figs., 4 tabs.

**35357** (UCRL-JC–106988) **Positron lifetimes in solids from first principles calculations.** Sterne, P.A. (Lawrence Livermore National Lab., CA (United States)); O'Brien, J.C.; Howell, R.H.; Kaiser, J.H. Lawrence Livermore National Lab., CA (United States). 7 Aug 1991. 10p. Sponsored by Welch (Robert A.) Foundation, Houston, TX (United States). DOE Contract W-7405-ENG-48. Grant Y-1135. (CONF-9108150–2: 9. international conference on positron annihilation, Szombathely (Hungary), 26-31 Aug 1991). Order Number DE92000088. Source: OSTI; NTIS; INIS; GPO Dep.

We present a first principles method for calculating positron lifetimes in solids, based on self-consistent calculations using the Linear Muffin-Tin Orbital method. Local density approximations are used for both electron-electron and electron-positron interactions. Results are presented for a variety of elemental metals and vacancies to demonstrate the reliability of this approach. Theoretical calculations of positron lifetimes can be used to interpret experimental data. As an examples of this, we interpret our experimental lifetime data for the oxide superconductor $Ba_{1-x}K_xBiO_3$ using calculations based on this method. 12 refs., 3 figs.

Dept. of Physics); MacDonald, A.H.; Norman, M.R. Argonne National Lab., IL (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;FG02-86ER45247. (CONF-9107170–1: CAP-NSERC workshop on theoretical physics, Ontario (Canada), 28 Jul - 3 aug 1991). Order Number DE91018551. Source: OSTI; NTIS; INIS; GPO Dep.

To explore a possible superconducting phase, the microscopic mean- field equations are solved for the case of a two-dimensional electron system in the strong magnetic field limit where the Landau level quantization invalidates the semiclassical approximations in the Ginzburg-Landau (GL) theory. For delta-function attractive interactions there exist n + 1 pairing channels in the n – th Landau level. For $n \geq 1$ the order parameter differs markedly from expectations based on the GL theory and the excitation spectrum has a zero gap.

**35359** (CONF-8906112–, pp. 108-113) **Superconducting hysteresis and the Preisach model.** Mayergoyz, I.D. (Univ. of Maryland, College Park (USA)); Keim, T.A. Argonne National Lab., IL (United States). [1989]. From 7. symposium on energy engineering sciences; Argonne, IL (United States); 19-21 Jun 1989. In *Proceedings of the seventh symposium on energy engineering sciences: Nonlinear mechanics and mechanical systems.* 239p. Order Number DE90000872. Source: OSTI; NTIS.

It is suggested to use the Preisach hysteresis model for the description of superconducting hysteresis. It is shown that the Bean (critical) state model and its further generalizations are very particular cases of the Preisach model. It is also shown that noncyclic hysteresis losses in superconductors can be evaluated by using the Preisach model and experimentally measured first-order transition curves. In the area of magnetics, the Preisach model has long been used for the description of hysteresis of ferromagnetic materials. Recently, the phenomenological nature of the Preisach model has been revealed, and it has been emphasized that under certain conditions this model can be used for the description of hsteresis of any physical nature. It has also been shown that, by using the Preisach model, noncyclic hysteresis losses can be easily evaluated. In this paper, it is suggested to use the Preisach model for the description of superconducting hysteresis. It is shown that the critical state model and its generalizations are very particular cases of the Preisach model. It is proposed to evaluate hysteresis losses in superconductors by using the Preisach model and experimentally measured first-order transition curves.

**35362** (DESY–91-038) **Two-dimensional gravities and supergravities as integrable systems.** Nicolai, H. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1991. 46p. (CONF-9103180–: 30. Schladming winter school on nuclear physics: Recent aspects of quantum fields, Schladming (Austria), 27 Feb - 8 mar 1991). Order Number DE92714442. Source: OSTI; NTIS (US Sales Only); INIS.

After a general introduction to the hidden symmetries of Einstein's theory of relativity in three space-time dimensions the author explains, why this theory and its supersymmetric generalizations become integrable after the reduction to two dimensions considering as example colliding plane wave solutions of Einstein's field equations. Thereafter the group-theoretical structure of this theory is considered. (HSI).

**35363** (INS–879) **Future prospects of pregeometry.** Terazawa, Hidezumi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1991. 19p. Order Number DE92704278. Source: OSTI; NTIS (US Sales Only); INIS.

Pregeometry is a theory, first suggested by Sakharov in 1967, in which gravity is taken as a quantum effect of matter fields and in which Einstein's theory of general relativity for gravity appears as an approximate and effective theory at long distances. It is shown by reviewing the extensive developments of pregeometric theories of gravity for the last more than a decade that the original idea by Sakharov is really working. Many future prospects of the theories are discussed in some detail. (author).

**35364** (JINR-D–4-89-221, pp. 13-17) **Geometric theory of gravitation.** Chernikov, N.A. (Joint Inst. for Nuclear Research, Dubna (USSR)). Joint Inst. for Nuclear Research, Dubna (USSR). 1989. (In Russian). (CONF-8810552–: Workshop on development and construction of gravitational wave emitter and detector, Dubna (USSR), 11-13 Oct 1988). In *Proceedings of workshop on the development and construction of gravitational wave emitter and detector.* 154p. Order Number DE92001311. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of geometric gravitation theory is discussed. An important geometric object - affine connection - is lost in the Einstein gravitation theory. It is noted that the detection of the lost object allows one to make the theory quite geometric. 1 ref.

**35365** (JINR-D–4-89-221, pp. 18-21) **On possible physical interpretation of Chernikov background connection.** Kapustsik, Eh. (Joint Inst. for Nuclear Research, Dubna (USSR)). Joint Inst. for Nuclear Research, Dubna (USSR). 1989. (In Russian). (CONF-8810552–: Workshop on development and construction of gravitational wave emitter and detector, Dubna (USSR), 11-13 Oct 1988). In *Proceedings of workshop on the development and construction of gravitational wave emitter and detector.* 154p. Order Number DE92001311. Source: OSTI; NTIS (US Sales Only); INIS.

The message aim is to show that based on the recent Chernikov works it is possible to formulate a new gravitation theory which does not contain any constants in the basic equations. In this case the gravitation interaction constant occurs at the level of constitutive relations. 7 refs.

Tensor representations of certain energy-momentum pseudotensors of the gravitational field are considered. Gravitational field energy-momentum tensors appear to be background connection tensor functionals on a manifold with symmetric background affine connection. If the background connection is not metric them the local conservation laws are absent. Nevertheless a certain conserved integral value exists under certain conditions. 8 refs.

Diagnosis and analysis techniques for linear systems have been developed and refined to a high degree of precision. In contrast, techniques for the analysis of data from nonlinear systems are in the early stages of development. This paper describes a time series technique for the analysis of data from nonlinear systems. The input and response time series resulting from excitation of the nonlinear system are embedded in a state space. The form of the embedding is optimized using local canonical variate analysis and singular value decomposition techniques. From the state space model, future system responses are estimated. The expected degree of predictability of the system is investigated using the state transition matrix. The degree of nonlinearity present is quantified using the geometry of the transfer function poles in the z plane. Examples of application to a linear single-degree-of-freedom system, a single-degree-of-freedom Duffing Oscillator, and linear and nonlinear three degree of freedom oscillators are presented. 11 refs., 9 figs.

An experiment is being developed which will compare the acceleration, g, of the antiproton in the earth's gravitational field with that of $H^{minus}$ ions. This measurement will constitute the first direct test of the Weak Equivalence Principle (WEP) for antimatter. Low energy antiprotons from the LEAR facility at CERN will be decelerated, cooled and launched into a field free region, and the time of flight to a detector will determine g. The technical aspects of the experiment and our progress in the different areas are presented. 4 refs., 1 fig.

The quality of propagated Laser light strongly depends on the degree of phase uniformity across the beam at its source. When propagating through turbulent atmosphere, a Strehl ratio of nearly 0.9 is possible if phase correction is made at all spatial scales greater than approximately $r_o$, the Fried atmospheric cell size. Therefore $r_o$ is a reasonable choice for actuator spacing on the phase compensating adaptive optics. However, analysis of high energy laser propagation has shown that a control law designed to compensate only for atomspheric index fluctuations will drive thermal blooming instabilities. Small initial perturbations in beam irradiance will grow exponentially until the beam breaks up. Therefore it is necessary also to compensate for irradiance perturbations at the same spatial scale as the compensation for phase. Combined phase and irradiance compensation of an HEL has been shown to be stable in theory. Irradiance control can be accomplished with a pair of deformable mirrors spaced apart over a propagation path. Laser light reflected off of the first deformable mirror surface at $z = 0$ will result in magnitude perturbations some distance away at $z = L$. The second deformable mirror then recollimates the light. The purpose of simulating the irradiance compensation system is to test the baseline design in such a way that the effect of discrete actuator/sensors and beam edge effects is taken into account in a more realistic manner than can be performed by a 2-D fourier analysis. 7 refs., 9 figs.

Significant progress has been made toward solving the century-old problem of chromatic aberrations in diffractive optics. Our approach exploits modern materials and microfabrication technology and is very different from the "purely diffractive strategy," which is commonly employed and which results in multiple diffractive elements separated by a finite distance. We have developed a Fresnel zone plate lens comprised of a serial stack of patterned minus-filters which allows broadband radiation to be focused (or imaged) without longitudinal or transverse chromatic aberrations. 7 refs., 4 figs.

The Plasma Science Committee (PLSC) is a standing committee under the auspices of the Board on Physics and Astronomy, Commission on Physical Sciences, Mathematics, and Applications of the National Academy of Sciences–National Research Council. Plasma sciences represent a broad and diverse field. The PLSC has accepted the responsibility of monitoring the continuing development and assessing the general health of the field as whole. Although select advisory bodies have been created to address specific issues that affect plasma science, such as the Fusion Policy Advisory Committee (FPAC), the PLSC provides a focus for the plasma science community that is unique and essential. The membership of the PLSC is drawn from research laboratories in universities, industry, and government. Areas of expertise on the committee include accelerators and beams, space physics, astrophysics, computational physics and applied mathematics, fusion plasmas, fundamental experiments and theory, radiation sources, low temperature plasmas, and plasma-surface interactions. The PLSC is well prepared to respond to requests for studies on specific issues. This report discusses ion of the PLSC work.

Self-consistent MHD equilibria are found with the RIP computer code, which traces lower hybrid and fast wave rays in two dimensions; the tokamak flux surfaces are generated by LHCD, FWCD and the bootstrap effect. The bootstrap current dominates at the mid-minor radius, the FWCD provides the seed current and LHCD is effective only in the surface region of a fusion-grade tokamak. The bootstrap fraction maximizes by operating at high central safety factor, $q(0) \approx 2$, that is, with rather minimal FWCD; while the total current is effectively controlled by LHCD. There is potentially considerable flexibility to affect the current profile and MHD stability by appropriate adjustments to the RF power spectra. Current drive on ITER is more attractive at higher aspect ratios, and results are presented for A = 4.0. 6 refs.

**35378** (ANL/FPP/TM–256) **Inductive currents in an rf driven plasma.** Kinsey, J.; Ehst, D.A. Argonne National Lab., IL (United States). Fusion Power Program. Aug 1991. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92000491. Source: OSTI; NTIS; INIS; GPO Dep.

Inductive effects are included in a self-consistent current drive model for axisymmetric tokamak plasmas used in the two-dimensional current drive/MHD equilibrium code, RIP. Previous simulations of current driven equilibria allowed for the steady-state calculation of bootstrap and RF currents. The addition of an inductive current is applied to enhance accurate design and interpretation of tokamak experiments. A convenient expression for the ohmic resistance in a tokamak plasma is derived to aid in the design of reactor grade MHD equilibria. 7 refs., 3 figs., 1 tab.

**35379** (CONF-910869–10) **ECH experiments on ATF.** Bigelow, T.S. (Oak Ridge National Lab., TN (United States)); Wilgen, J.B.; Baylor, L.R.; Murakami, M.; Schaich, C.R.; Lindley, R. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on radio frequency power in plasmas; Charleston, SC (United States); 12-14 Aug 1991. Order Number DE91018845. Source: OSTI; NTIS; INIS; GPO Dep.

Several electron cyclotron heating (ECH) experiments have been completed on the Advanced Toroidal Facility (ATF) at Oak Ridge National Laboratory (ORNL) under a variety of operating conditions and launch polarizations. ECH power is launched using a polarization-controlled beam launcher and microwave detectors are used to measure absorption of first-pass and multiply-reflected power. Measurements show that first-pass absorption efficiency at low plasma density is highly dependent on magnetic field, polarization, and plasma conditions. Wave polarization rotation has been detected, it is caused by the large magnetic field shear on ATF. Detector signals indicate that absorption efficiency is relatively high for medium plasma density at either fundamental or second harmonic operation. Plasmas have also been sustained using the third harmonic cyclotron resonance where absorption efficiency is much lower. Gyrotron power modulation and turn-off experiments have been performed to study power deposition and transport using plasma diagnostics. These experiments show that power absorption is fairly efficient. However, the power deposition profile is rather broad despite the relatively narrow launcher beam. This effect can be attributed to several factors including the broad extent of the resonant surface and the ~45% of power contained in both low-level sidelobes outside the launcher beam and in the wrong plasma mode. 3 refs., 3 figs.

**35380** (CONF-910869–13) **Full-wave calculation of fast-wave current drive in tokamaks including $k_{\|}$ upshifts.** Jaeger, E.F.; Batchelor, D.B. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on radio frequency power in plasmas; Charleston, SC (United States); 12-14 Aug 1991. Order Number DE92000048. Source: OSTI; NTIS; INIS; GPO Dep.

Numerical calculations of fast-wave current drive (FWCD) efficiency have generally been of two types: ray tracing or global wave calculations. Ray tracing shows that the projection of the wave number (k||) along the magnetic field can vary greatly over a ray trajectory, particularly when the launch point is above or below the equatorial plane. As the wave penetrates toward the center of the plasma, k|| increases, causing a decrease in the parallel phase speed and a corresponding decrease in the current drive efficiency, $\gamma$. But the assumptions of geometrical optics, namely short wavelength and strong single-pass absorption, are not greatly applicable in FWCD scenarios. Eigenmode structure, which is ignored in ray tracing, can play an important role in determining electric field strength and Landau damping rates. In such cases, a full-wave or global solution for the wave fields is desirable. In full-wave calculations such as ORION k|| appear as a differential operator $(\vec{B}\cdot\nabla)$ in the argument of the plasma dispersion function. Since this leads to a differential system of infinite order, such codes of necessity assume $k_{\|} \sim k_{\varphi}$ = const, where $k_{\varphi}$ is the toroidal wave number. Thus, it is not possible to correctly include effects of the poloidal magnetic field on k||. The problem can be alleviated by expressing the electric field as a superposition of poloidal modes, in which case k|| is purely algebraic. This paper describes a new full-wave calculation, Poloidal Ion Cyclotron Expansion Solution, which uses poloidal and toroidal mode expansions to solve the wave equation in general flux coordinates. The calculation includes a full solution for E|| and uses a reduced-order form of the plasma conductivity tensor to eliminate numerical problems associated with resolution of the very short wavelength ion Bernstein wave.

**35381** (CONF-910869–14) **Ray tracing and absorption of electron cyclotron waves in the L-2 stellarator.** Goldfinger, R.C. (Oak Ridge National Lab., TN (United States)); Likin, K.M.; Ochirov, B.D. Oak Ridge National Lab., TN (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on radio frequency power in plasmas; Charleston, SC (United States); 12-14 Aug 1991. Order Number DE92000741. Source: OSTI; NTIS; INIS; GPO Dep.

The absorption of electron cyclotron waves in L-2 stellarator plasmas has been investigated by adapting the RAYS geometrical optics code developed at Oak Ridge National Laboratory to the parameters of L-2. Two heating schemes were considered: Low-field launching of the ordinary wave at the fundamental resonance and low-field launching of the extraordinary wave at the second harmonic. Significant power absorption (up to 100%) of the extraordinary mode at the second harmonic resonance was obtained. A multipass absorption model was used to estimate the contribution to plasma heating of the power that remains after the first pass which is subsequently reflected from the vessel walls. Finally, results obtained with the RAYS code and with a code developed at the Institute of Automation and Electrometry were compared and found to be in good agreement. 6 refs., 4 figs.

**35382** (CONF-9109200–1) **Full-wave calculation of fast-wave current drive in tokamaks including $k_{parallel}$ variations.** Jaeger, E.F; Batchelor, D.B. Oak Ridge National Lab., TN (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International workshop on fast wave current drive in reactor scale tokamaks synergy and complementarity with LHCD and ECRH; Cadarache (France); 23-25 Sep 1991. Order Number DE92000076. Source: OSTI; NTIS; INIS; GPO Dep.

When fast waves propagate inward from the edge of a tokamak toward the plasma center, the $k_{\perp}$ spectrum produced by the antenna is not maintained but is shifted and deformed due to the presence of the finite poloidal magnetic field. This $k_{\perp}$ shift causes

a variation in the parallel phase speed of the wave and can therefore have a strong effect on electron damping and current drive efficiency. In this paper, we include this effect in a new full-wave calculation (PICES) which represents the wave fields as a superposition of poloidal modes, thereby reducing $k\perp$ to an algebraic operator. The wave equation is solved in general flux coordinates, including a full (non-perturbative) solution for $E\perp$ and a reduced-order dielectric formulation to eliminate short-wavelength ion Bernstein modes. A simplified current drive model which includes particle trapping is used to estimate the effect of the $k\perp$ shift on current drive efficiency in ITER and D3-D. Results suggest that when single-pass absorption is weak, reflected power may drive current nearly as efficiently as that absorbed on the first pass. 15 refs., 5 figs.

**35383** (DOE/ER/53198–180) **Measurement of magnetic fluctuations at small spatial scales in the Tokapole II tokamak.** Haines, E.J. Wisconsin Univ., Madison, WI (United States). Aug 1991. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE92000161. Source: OSTI; NTIS; INIS; GPO Dep.

This thesis is a presentation of the measurements of short-wavelength, high-frequency radial magnetic fluctuations performed on the Tokapole 2 tokamak at the University of Wisconsin-Madison. Theories of electron temperature gradient ($\eta_e$) driven turbulence predict the existence of increased magnetic fluctuation power at small spatial scales near the collisionless skin depth $c/\omega_{pe}$ and over a wide range of frequencies near and below the electron diamagnetic drift frequency $\omega^*_{re}$. Small magnetic probes of sizes down to 1 m m have been constructed and used to resolve short poloidal and radial wavelength magnetic fluctuations. These probes have been used with larger probes to make comparisons of fluctuation spectra measured in various ranges of wavelength and over the range of frequencies from 10 kHz to 6 MHz in Tokapole 2 plasmas. A calculation of the short-wavelength, high-frequency response of an electrostatically shielded model $B_r$ probe has been performed to guide the interpretation of the power comparison measurements. Comparisons of magnetic fluctuation spectra at various positions within the plasma, and for discharges with edge safety factor 1, 2, and 3 are presented. The linear and nonlinear theories and numerical simulations of $\eta_e$ turbulence are reviewed and compared, where possible with the experimental parameters and results.

**35384** (DOE/ER/53198–181) **Manifestations of the MHD and kinetic dynamo through soft x-rays.** Chartas, G.A. Wisconsin Univ., Madison, WI (United States). Aug 1991. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE92000162. Source: OSTI; NTIS; INIS; GPO Dep.

The underlying mechanisms that produce and sustain the reversed toroidal field in RFP's are investigated by analyzing 2Dx-ray emissivity reconstruction and by correlating the evolution of the hot electron properties to the reversed toroidal magnetic field. Reconnection of emissivity surfaces as seen in soft x-ray (SXR) reconstructing occur near the predicted resonant surface for the m=1, n=5, 6,-7 resistive tearing modes. Two distinct rates of reversed magnetic field generation are observed. First, in the MHD relaxation phase a sudden increase in $B_t(a)$ is detected. This event coincides with a large increase in the edge hot electron current density. The second mode of flux generation is observed t have a slower rate and occurs during the diffusion phase. A variation of the edge hot electron current density by a factor of four produced only a small change in the measured $B_t(a)$, implying the contributions of the hot electrons to the dynamo during the diffusion phase is small. $\tilde{T}_e$, $/<T_{e,hot}>$ was measured to be approximately 60%, which is much larger than the corresponding quantity for the bulk component which is about 30%. Scaling of the magnetic Reynolds number with the diffusion and MHD relaxation time, $\tau_{MHD}$ indicated that the $\tau_{MHD}$ does not have a strong dependence on the Spitzer resistivity whereas the diffusion time does depend on the classical resistivity. SXR emission mode analysis during the transition from a rotating to a locked plasma shows a decrease in the m=1 Fourier Bastille component of the emissivity. This is due to the flattening of the emissivity profile as seen in the SXR reconstructions.

**35385** (DOE/ER/53198–182) **Soft x-ray measurement of internal tearing mode structure in a reversed-field pinch.** Chartas, G.; Hokin, S. Wisconsin Univ., Madison, WI (United States). Dept. of Physics. 16 Sep 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE92000164. Source: OSTI; NTIS; INIS; GPO Dep.

The structure of internally resonant tearing modes has been studied in the Madison Symmetric Torus reversed-field pinch with a soft x-ray detector system consisting of an imaging array at one toroidal location and several detectors at different toroidal locations. The toroidal mode numbers of m = 1 structures are in the range n = −5, −6, −7. The modes propagate with phase velocity v = 1–6 × $10^6$ cm/s, larger than the diamagnetic drift velocity $v_d \sim 5 \times 10^5$ cm/s. Phase locking between modes with different n in manifested as a beating of soft x-ray signals which is found to be strongest near the resonant surfaces of the modes (r/a = 0.1 – 0.5). 15 refs., 5 figs.

**35386** (DOE/ER/53207–6) **Application of modern mathematical concepts to plasma confinement: Progress report.** Cary, J.R. Colorado Univ., Boulder, CO (United States). Aug 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53207. Order Number DE92000053. Source: OSTI; NTIS; INIS; GPO Dep.

Progress in three research areas has been achieved. (1) A new expression for the trapping probability for transitioning particles in asymmetric toroidal plasma confinement devices (e.g., stellarators and rippled tokamaks) has been derived. Comparison with numerical integrations shows that this new expression is more accurate than those of previous workers. (2) Simulations show that the dynamical enhancement of the turbulent diffusion coefficient over quasilinear observed in test particle simulations occurs also in selfconsistent plasma turbulence. (3) The simple method for calculating magnetic island widths discussed in the previous report has been published.

**35387** (DOE/ER/53223–169) **Plasma properties: Progress report, January 1, 1991–December 31, 1991.** Weitzner, H. New York Univ., NY (United States). Courant Inst. of Mathematical Sciences. **35389** (DOE/ER/53256–2) **The optimization of production and control of hot-electron plasmas.** Applied Microwave Plasma Concepts, Inc., Carlsbad, CA (United States). 17 Mar 1989. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER53256. Order Number DE91018741. Source: OSTI; NTIS; INIS; GPO Dep.

The present project was initially undertaken to develop a number of innovative concepts for using electron cyclotron heating (ECH) to enhance tokamak performance. A common feature of the various applications under consideration is efficient, spatially-localized generation of hot-electron plasmas; and the first phase of the work addressed the basic aspects of an approach to achieving this Upper Off-Resonant Heating (UORH) and open-resonator couplers to confine the weakly damped microwave power to the particular region where the hot electrons are to be generated. The results of the first year's work provided strong evidence that hot-electron

plasmas with electron energies of hundreds of keV could be generated using multiple-frequency ECH and fully-toroidal open-resonator couplers. The evidence was sufficiently compelling to suggest that the project be focused on a suitable near-term application to the TEXT device.

35390 (DOE/ER/53256–3) **The optimization of production and control of hot-electron plasmas: Annual technical report.** Applied Microwave Plasma Concepts, Inc., Carlsbad, CA (United States). 29 Jun 1990. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER53256. Order Number DE91018742. Source: OSTI; NTIS; INIS; GPO Dep.

The present project was initially undertaken to develop a number of innovative concepts for using electron cyclotron heating (ECH) to enhance tokamak performance. For example, since the efficiency of steady-state RF current drive increases linearly with the energy of the current carrier, the recirculating power needed to sustain tokamak reactors can be reduced to attractive values if the current is carried by a small minority group of superthermal electrons. Again, it has been predicted that the high-beta second regime of stable tokamak operation could be reached if layers of energetic electrons could be formed during the startup. It is also possible to use ECH to suppress MHD modes, including sawteeth and internal kinks, and to modify ambipolar potentials for enhanced confinement. A common element of these concepts is the efficient, spatially-localized generation of hot-electron plasmas. The first phase of the work investigated an approach to achieving this under Upper Off-Resonant Heating and open-resonator couplers to confine the weakly damped microwave power to the particular region where the hot electrons are to be generated. The results of the first year's work provided strong evidence that hot-electron plasmas with electron energies of hundreds of keV could be generated using multiple-frequency ECH and toroidal open-resonator couplers. The evidence was sufficiently compelling to suggest that the project be focused on a suitable near-term application to the TEXT device.

35391 (DOE/ET/53088–518) **Continuum damping of high mode number toroidal Alfven waves.** Rosenbluth, M.N. (California Univ., San Diego, La Jolla, CA (United States). Dept. of Physics); Berk, H.L.; Lindberg, D.M.; Van Dam, J.W. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Aug 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088 ;FG03-88ER53275. (IFSR–518). Order Number DE91018891. Source: OSTI; NTIS; INIS; GPO Dep.

An asymptotic theory is developed to determine the continuum damping of short-wavelength Toroidal Alfven Eigenmodes, which is essential for ascertaining thresholds for alpha particle driven instability in ignited tokamaks. 9 refs., 1 fig. 1 tab.

35392 (GA-A–20614) **The multipulse Thomson scattering diagnostic on the DIII-D tokamak.** Carlstrom, T.N.; Campbell, G.L.; DeBoo, J.C.; Evanko, R.G.; Evans, J.; Greenfield, C.M.; Haskovec, J.S.; Hsieh, C.L.; McKee, E.L.; Snider, R.T.; Stockdale, R.E.; Thomas, M.P.; Trost, P.K. General Atomics, San Diego, CA (United States). Sep 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-910968–5: 14. IEEE symposium on fusion engineering, San Diego, CA (United States), 30 Sep - 3 oct 1991). Order Number DE92000262. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the design and operation of a 40-spatial channel Thomson scattering system that uses multiple 20 Hz Nd:YAG lasers to measure the electron temperature and density profiles periodically throughout an entire plasma discharge. Interference filter polychromators disperse the scattered light which is detected by silicon avalanche photodiodes. The measurable temperature range from 10 eV to 20 keV and the minimum detectable density is about $2 \times 10^{18}$ $m^{-3}$. Laser control and data acquisition are performed in real-time by a VME-based microcomputer. Data analysis is performed by a MicroVAX 3400. Unique features of this system include "burst mode" operation, where multiple lasers are fired in rapid succession (< 10 KHz), real-time analysis capability, and laser beam quality and alignment monitoring during plasma operation. Results of component testing, calibration, and plasma operation are presented. 8 refs. 6 figs.

35393 (GSI–91-24) **Investigation of the energy loss and the charge state of high energy heavy ions in a hydrogen plasma.** Dietrich, K.G. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany); Heidelberg Univ. (Germany). Jul 1991. 84p. (In German). Order Number DE92714362. Source: OSTI; NTIS (US Sales Only); INIS.

For heavy ions with energy of 1.4 to 5.9 MeV/u the energy loss and charge state after transmission through a totally ionized hydrogen plasma are investigated. Plasma target was a Z-pinch device incorporated in the beam optics of the accelerator by a pumping system. In the 20 cm long pinch hydrogen plasmas with densities up to $1.5 \times 10^{19}$ $cm^{-3}$ and temperatures above 5 eV are produced, with ionization efficiency higher than 99%. The ions pass the plasma on the symmetry axis of the plasma column through small apertures in the electrodes. The energy loss was measured by time-of-flight method, the plasma density by interferometry along the pinch axis. For the first time the ion charge after transmission through the plasma has been determined by a charge spectrometer being a combination of a dipole magnet and a position sensitive detector with high time resolution. A growth of the average charge of heavy ions in plasma higher than the equilibrium charge in cold gas was discovered, caused by a reduction of electron capture by fast heavy ions in ionized matter. The electron loss rates in plasma and cold gas are equal. (orig./AH).

35394 (IPP–2/312) **On the existence and uniqueness of dissipative plasma equilibria in a toroidal domain.** Spada, M.; Wobig, H. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jun 1991. 28p. Order Number DE92714339. Source: OSTI; NTIS (US Sales Only); INIS.

A one-fluid, dissipative magnetohydrodynamic model of plasma equilibrium in a torus is considered. The equations include inertial forces, finte resistivity and viscosity, and a particle source which sustains the pressure gradient in the plasma; viscosity is described by the Braginskii operator. Plasma density, resistivity and viscosity coefficients are assumed to be uniform. A boundary-value problem in a general toroidal domain is formulated, no further assumption on the domain being made besides a sufficient regularity of its boundary. The system of equations is reduced to a problem with unknowns p, v, B (p denotes the scalar pressure, v the flow velocity, B the magnetic field). A functional setting of the equations is established and, generalizing the classical mathematical techniques adopted in the theory of viscous incompressible flow to investigate the solvability of the steady-state Navier-Stokes equations, a problem for weak solutions is formulated which is shown to be equivalent to solving a nonlinear equation in a separable Hilbert space. Then, by analysing the Braginskii viscosity in the established functional framework, we find properties which allow to write the above equation as a fixed-point equation. Main results of our analysis are the following: (i) We prove the existence of at least one weak solution if the source is sufficiently small, or viscosity and resistivity sufficiently large; (ii) We obtain an estimate of the solution(s); (iii) We prove that, under a condition of the same kind as that for existence, but more stringent, there exists only one solution; (iv) The well known existence and uniqueness results for the steady-state Navier-Stokes problem are recovered when the magnetic field is set equal to zero. (orig.).

35395 (IPP–4/246) **Steady-state operation requirements of tokamak fusion reactor concepts.** Knobloch, A.F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jun 1991. 48p. Order Number DE92714340. Source: OSTI; NTIS (US Sales Only); INIS.

In the last two decades tokamak conceptual reactor design studies have been deriving benefit from progressing plasma physics experiments, more depth in theory and increasing detail in technology and engineering. Recent full-scale reactor extrapolations such as the US ARIES-I and the EC Reference Reactor study provide information on rather advanced concepts that are called for when economic boundary conditions are imposed. The ITER international reactor design activity concentrated on defining the next step after the JET generation of experiments. For steady-state operation as required for any future commercial tokamak fusion power plants it is essential to have non-inductive current drive. The current drive power and other internal power requirements specific to magnetic

confinement fusion have to be kept as low as possible in order to attain a competitive overall power conversion efficiency. A high plasma Q is primarily dependent on a high current drive efficiency. Since such conditions have not yet been attained in practice, the present situation and the degree of further development required are characterized. Such development and an appropriately designed next-step tokamak reactor make the gradual realization of high-Q operation appear feasible. (orig.).

**35396** (IPP–6/298) **Localization of modes in media with simple quasiperiodic modulation.** Salat, A. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jun 1991. 25p. Order Number DE92714301. Source: OSTI; NTIS (US Sales Only); INIS.

The spectrum and the solutions of the 1-D Schroedinger equation with a quasiperiodic potential V are investigated numerically. Quasiperiodicity in contrast to periodicity makes possible the localization of modes. V is taken as the sum of two incommensurate periodic $\delta$-function series. The spectrum consists of bands separated by gaps which correspond to plateaus in the winding number. The spectrum of extended solutions (three-frequency-quasiperiodic) is found from the initial value problem. Localized solutions cannot be found in this way, owing to numerical instability. Instead, localized solutions (exponential decay on both sides) and the concomitant point spectrum are obtained from a boundary value method. An alternative method to find the point spectrum for bounded potentials is proved valid also for $\delta$-function potentials, as used here. Connections with the MHD spectrum of toroidal plasmas and Alfven wave heating are pointed out. (orig.).

**35397** (IPP–III/175) **Tomographical investigation of internal disruptions in the tokamaks ASDEX and TFTR.** Buechse, R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Apr 1991. 115p. (In German). Order Number DE92714342. Source: OSTI; NTIS (US Sales Only); INIS.

The subject of this work is the investigation of the most important MHD-instability, the so-called 'internal disruption' or 'sawtooth instability' in the center of a tokamak by tomographical analysis of the soft X radiation. Only plasmas heated by neutral atom beam injection are examined, where momentum transfer causes a toroidal plasma rotation. After magnetohydrodynamics and sawtooth oscillations, plasma radiation, the experimental construction of the soft X radiation diagnostics and the used methods of tomography, the experimental results of sawtooth oscillations in ASDEX and TFTR tokamaks are discussed and summarized. (orig.).

**35398** (IPP–III/176) **Characterization of edge plasma fluctuations in ASDEX.** Qin, J. (Academia Sinica, Beijing (China). Inst. of Physics); Carlson, A.; Endler, M.; Giannone, L.; Niedermeyer, H.; Rudyj, A.; Theimer, G. ASDEX Team. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Apr 1991. 21p. Order Number DE92714300. Source: OSTI; NTIS (US Sales Only); INIS.

Nonlinear dynamical characterizations of the edge plasma fluctuations measured by both $H_\alpha$-light diagnostic and Langmuir probes in ASDEX are presented. The edge plasma fluctuations are stochastic rather than chaotic, they have a higher-dimensional structure in phase space. In time, the edge turbulence is found to have memory properties, the time required to lose the memory is different in the different cases. (orig.).

**35399** (IPP–III/177) **Investigation of the plasma bremsstrahlung in the near infrared for $Z_{eff}$ determination and electron density feedback control in tokamak devices.** Kurzan, B. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Oct 1990. 69p. (In German). Order Number DE92714327. Source: OSTI; NTIS (US Sales Only); INIS.

In the ASDEX Thomson scattering system the scattered light of a Nd:YAG laser beam ($\lambda$ = 1064 nm) is measured to obtain electron density and temperature profiles every 16 ms. The same system is continuously used to measure bremsstrahlung in the near infrared, allowing determination of radial $Z_{eff}$ profiles. Furthermore, the diagnostic can also be used for real time control of the electron density. This applies in particular in cases where large sawteeth and pellet injection generate counting errors in the interferometer signal. The relation between the line density n and the central chord bremsstrahlung signal $U_b$ was investigated for different heating scenarios in a wide density range. (orig.).

Impurity transport and neoclasscial predictions; confinements studies; H-mode studies; density limit studies; lower hybrid and ICRH; impurity and divertor studies; diagnostics. (orig./AH).

**35401** (Juel–2423) **Longitudinal transport coefficients of a magnetized plasma consisting of hydrogen and a single impurity element in arbitrarily populated charge states.** Claassen, H.A. (Forschungszentrum Juelich GmbH (Germany, F.R.). Inst. fuer Plasmaphysik); Gerhauser, H.; El-Sharif, R.N. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Plasmaphysik. Jan 1991. 53p. Order Number DE92711173. Source: OSTI; NTIS (US Sales Only); INIS.

The coefficients determining the transport processes along the magnetic field in a magnetized plasma consisting of electrons, protons/deuterons and impurity ions in various charge states have been calculated on the basis of Grad's 21 moment approximation. Assuming a single impurity element, the determinants appearing in the transport coefficients are evaluated analytically for arbitrary ratios $m_z/m_+$ between the impurity and hydrogen masses. The general formulae are then simplified for the important case $m_z/m_+ \geq 1$ and compared with existing data given by V.M. Zhdanov et al. and Yu.L. Igitkhanov et al. Whereas with minor modifications the proton/deuteron and electron coefficients agree well, there are remarkable differences in the impurity ion transport coefficients, which are discussed. (orig.).

**35402** (Juel–2432) **Investigation of E x B transport with a multi-electrode probe in the plasma boundary of TEXTOR. First results.** Ivanov, R.S. (AN SSSR, Moscow (USSR). Inst. Vysokikh Temperatur); Bora, D.; Moyer, R.A.; Nieuwenhove, R. van; Oost, G. van; Fuchs, G.; Hoethker, K.; Samm, U. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Plasmaphysik. Jan 1991. 51p. Order Number DE92711172. Source: OSTI; NTIS (US Sales Only); INIS.

A movable multi-element Langmuir probe was implemented in TEXTOR in order to study properties of the edge and scrape-off plasma. The probe has five graphite electrode pins allowing the simultaneous measurement of main parameters such as plasma densities, electron temperatures, floating potentials, poloidal and radial electric fields. Both time-averaged and fluctuating quantities have been considered in order to evaluate the DC and turbulence-driven cross-field particle fluxes. The spectral analysis of the fluctuating floating potentials at spatially separated probe pins allows to determine the velocity associated with the rotations of the boundary plasma. The investigations have been focused on the variations of plasma boundary properties in plasmas with pure ohmic heating as well as auxiliary heating (ICRH). Special attention has been paid to the change of transport properties with the transition to a detached plasma. In particular, a significant reduction of the poloidal phase velocity at the limited edge has been observed for detached plasmas. Preliminary data on physical effects near the plasma boundary, which occur when the toroidal belt limiter (ALT-II) is biased, are reported. (orig.).

**35403** (KFTI–89-13) **Nonlinear Landau damping in a cross magnetic field.** Bulatova, R.F.; Onishchenko, I.N. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1989. 9p. (In Russian). Order Number DE91643139. Source: OSTI; NTIS (US Sales Only); INIS.

Method of particle computerized simulation was used to study the effect of a cross magnetic field on Landau damping. It is shown that nonlinear decrement of plasma wave damping is maximal at $\omega_b$tau~1 $\omega$-cyclotron frequency; tau-period of captured particle oscillations.

**35404** (LA-UR–91-2860) **Energetic alpha particle deposition in a magnetized plasma.** Smitherman, D.P.; Kirkpatrick, R.C. Los Alamos National Lab., NM (United States). [1991]. 6p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910626–13: 6. international conference on emerging nuclear energy systems, Monterey, CA (United States), 16-21 Jun 1991). Order Number DE92000316. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of energetic alpha particle deposition in a dense, magnetized deuterium-tritium (DT) thermonuclear fuel has been studied numerically for the case of coulomb interactions in cylindrical geometry. This was done by following the particle trajectories initiated at various radii and in different directions through the plasma and its imposed field until they had either left the plasma or deposited all their energy. The resulting complex particle trajectories in the static magnetized fuel make a detailed treatment of the problem computationally intensive. Therefore, we have attempted to use detailed modeling to produce a data base for a neural nets algorithm for incorporation in an ignition critical profile code. While the accuracy of the neutral net in reproducing the detailed calculational results is not high, it is approximately 6000 times faster. 7 refs., 1 fig.

**35405** (NIFS–83) **Density peaking in the JFT-2M tokamak plasma with counter neutral beam injection.** Ida, K. (and others); Itoh, S.; Itoh, K. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 22p. Order Number DE92713934. Source: OSTI; NTIS (US Sales Only); INIS.

A significant particle pinch and reduction of the effective thermal diffusivity are observed after switching the neutral beam direction from co- to counter- injection in the JFT-2M tokamak. A time delay in the occurrence of density peaking to that of plasma rotation is found. This shows that the particle pinch is related to the profile of the electric field as determined by the plasma rotation profile. The measured particle flux shows qualitative agreement with the theoretically-predicted inward pinch. (author).

**35406** (NIFS–86) **Geometrical effects of the magnetic field on the neoclassical flow, current and rotation in general toroidal systems.** Nakajima, N.; Okamoto, M. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 34p. Order Number DE92713937. Source: OSTI; NTIS (US Sales Only); INIS.

In order to clarify geometrical effects of the magnetic field on neoclassical theory, the neoclassical parallel particle flow, heat flux, current and plasma rotation of a multispecies plasma in general toroidal systems are examined in several collisionality regimes. The quantitative and qualitative differences between axisymmetric (tokamaks) and non-axisymmetric toroidal systems (stellarator, heliotron/torsatron) appear mainly through a geometrical factor which prescribes the parallel flow due to the gradients of the density, temperature, and electrostatic potential. In axisymmetric toroidal systems the geometrical factor reduces to the same expression in all collisionality regimes due to axisymmetry. By contrast, in non-axisymmetric toroidal systems, it changes drastically depending on the magnetic fieled structure and the collisionality regime. Thus, the poloidal flow has the radial electric field dependence. When the geometrical factor is very small, the ion parallel flow almost vanishes and the ion rotation consists of the diamagnetic and E vector x B vector flows (perpendicular flows). (author).

**35407** (NIFS–87) **ELMy-H mode as limit cycle and chaotic oscillations in tokamak plasmas.** Itoh, Sanae; Itoh, Kimitaka; Fukuyama, Atsushi; Miura, Yukitoshi. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 20p. Order Number DE92713938. Source: OSTI; NTIS (US Sales Only); INIS.

A model of Edge Localized Modes (ELMs) in tokamak plasmas is presented. A limit cycle solution is found in the transport equation (time-dependent Ginzburg-Landau type), which a has hysteresis curve between the gradient and flux. Periodic oscillation of the particle outflux and L/H intermediate state are predicted near the L/H transition boundary. A mesophase in spatial structure appears near edge. Chaotic oscillation is also predicted. (author).

**35408** (NIFS–89) **Nonlinear behavior of multiple-helicity resistive interchange modes near marginally stable states.** Sugama, Hideo; Nakajima, Noriyoshi; Wakatani, Masahiro. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 35p. Order Number DE92713940. Source: OSTI; NTIS (US Sales Only); INIS.

Nonlinear behavior of resistive interchange modes near marginally stable states is theoretically studied under the multiple-helicity condition. Reduced fluid equations in the sheared slab configuration are used in order to treat a local transport problem. With the use of the invariance property of local reduced fluid model equations under a transformation between the modes with different rational surfaces, weakly nonlinear theories for single-helicity modes by Hamaguchi and Nakajima are extended to the multiple-helicity case and applied to the resistive interchange modes. We derive the nonlinear amplitude equations of the multiple-helicity modes, from which the convective transport in the saturated state is obtained. It is shown how the convective transport is enhanced by nonlinear interaction between modes with different rational surfaces compared with the single-helicity case. We confirm that theoretical results are in good agreement with direct numerical simulations. (author).

**35409** (NIFS–90) **Radial transport induced by rotating RF fields and breakdown of intrinsic ambipolarity in a magnetic mirror.** Hojo, Hitoshi (Tsukuba Univ., Ibaraki (Japan). Plasma Research Center); Hatori, Tadatsugu. National Inst. for Fusion Science, Nagoya (Japan). Jun 1991. 17p. Order Number DE92713941. Source: OSTI; NTIS (US Sales Only); INIS.

Radial transport induced by rotating RF fields in a magnetic mirror is studied. The used RF frequency is in the ion cyclotron range of frequency and also comparable to the electron bounce frequency. The radial particle fluxes for ions and electrons are obtained by use of the gyrokinetic equation. With a positive azimuthal mode number of the RF field, the radial particle flux is outward for Maxwellian ions and is inward for Maxwellian electrons. This shows that the intrinsic ambipolarity is broken in this RF-induced transport. The present analysis can be applied to the thermal-barrier pumping of a tandem mirror. (author).

Laser-based diagnostic methods are developed to improve our understanding of the behavior of a flashover-type magnetically-insulated, pulsed-ion diode. Effects of neutral particles on the diode characteristics are examined with laser resonant interferometry. For the quantitative estimation of the particle density, a laser resonance scattering method is also applied. These techniques could allow direct determination of the particle distribution in the diode gap. A new diode which uses actively produced source plasma is developed for the investigation of the anode plasma effect on the diode characteristics. Two types of diode configurations are tested, over a wide range of pulse delays and peak flux of the source plasma injection. (author).

**35411** (ORNL–6624) **Fusion Energy Division annual progress report, period ending December 31, 1989.** Sheffield, J.; Baker, C.C.; Saltmarsh, M.J. Oak Ridge National Lab., TN (United States). The Fusion Program of Oak Ridge National Laboratory (ORNL) carries out research in most areas of magnetic confinement fusion. The program is directed toward the development of fusion as an energy source and is a strong and vital component of both the US fusion program and the international fusion community. Issued as the annual progress report of the ORNL Fusion Energy Division, this report also contains information from components of the Fusion Program that are carried out by other ORNL organizations (about 15% of the program effort). The areas addressed by the Fusion Program and discussed in this report include the following: Experimental and theoretical research on magnetic confinement concepts, engineering and physics of existing and planned devices, including remote handling, development and testing of diagnostic

tools and techniques in support of experiments, assembly and distribution to the fusion community of databases on atomic physics and radiation effects, development and testing of technologies for heating and fueling fusion plasmas, development and testing of superconducting magnets for containing fusion plasmas, development and testing of materials for fusion devices, and exploration of opportunities to apply the unique skills, technology, and techniques developed in the course of this work to other areas. Highlights from program activities are included in this report.

Particle-in-Cell (PIC) calculations have become an indispensable tool to model the nonlinear collective behavior of charged particle species in electromagnetic fields. Traditional finite difference codes, such as CONDOR (2-D) and ARGUS (3-D), are used extensively to design experiments and develop new concepts. A wide variety of physical processes can be modeled simply and efficiently by these codes. However, experiments have become more complex. Geometrical shapes and length scales are becoming increasingly more difficult to model. Spatial resolution requirements for the electromagnetic calculation force large grids and small time steps. Many hours of CRAY YMP time may be required to complete 2-D calculation – many more for 3-D calculations. In principle, the number of mesh points and particles need only to be increased until all relevant physical processes are resolved. In practice, the size of a calculation is limited by the computer budget. As a result, experimental design is being limited by the ability to calculate, not by the experimenters ingenuity or understanding of the physical processes involved. Several approaches to meet these computational demands are being pursued. Traditional PIC codes continue to be the major design tools. These codes are being actively maintained, optimized, and extended to handle large and more complex problems. Two new formulations are being explored to relax the geometrical constraints of the finite difference codes. A modified finite volume test code, TALUS, uses a data structure compatible with that of standard finite difference meshes. This allows a basic conformal boundary/variable grid capability to be retrofitted to CONDOR. We are also pursuing an unstructured grid finite element code, MadMax. The unstructured mesh approach provides maximum flexibility in the geometrical model while also allowing local mesh refinement. Both innovative approaches to electromagnetic PIC calculations are generalizable to 3-D.

This paper describes the experimental studies and associated numerical modelling of the interaction between a target and high speed, high temperature plasmas produced by a rail gun. Preliminary experimental results are presented. Brief descriptions are given of a new numerical technique for computing the collision integral of the Boltzmann equation which was developed. A two-dimensional numerical model for flow fields with coupled radiation from an emitting, absorbing, and scattering flow medium is also described.

Experiments with the 80-MHz prototype folded waveguide on the Radio-Frequency Test Facility (RFTF) at Oak Ridge National Laboratory have achieved substantially higher power levels than any previous tests on comparably sized loop antennas. This result, combined with a superior wave spectrum, suggests that the folded waveguide should be capable of several times the power flux of a loop antenna into a tokamak plasma. 6 refs., 2 figs.

The ANT and ORION codes have been combined and used to study the loading of various antenna geometries with simple three-dimensional (3-D) effects. Both codes use a slab model with periodic Fourier analysis for modeling the toroidal and poloidal directions. The ANT code is used to prescribe current sets in a vacuum region where the field solutions are obtained analytically of each Fourier mode and matching conditions are used at poloidal/toroidal current sheet locations. Multiple current sheets are permitted and various feeder options are available to model the radial antenna currents. Current elements maybe oriented at arbitrary angles to the static magnetic field and may be independently phased in time. The fields at the plasma surface are prescribed by an impedance matrix for each Fourier mode. The ORION code solves for the fields in the plasma region using finite difference techniques, a plasma dispersion relation that retains the lowest-order finite gyroradius effects, and all three electric field components. Results are presented for a folded waveguide mock-up and for a loop antenna design under identical plasma conditions.

**35418** (CONF-910869–12) **Design and performance of fast wave current drive systems in the ICRF.** Goulding, R.H. (Oak Ridge National Lab., TN (United States)); Baity, R.W.; Batchelor, D.B.; Carter, M.D.; Jaeger, E.F.; Hoffman, D.J.; Ryan, P.M.; Tolliver, J.S.; Mayberry, M.J.; Petty, C.C.; Pinsker, R.I.; Prater, R. Oak Ridge National Lab., TN (United States). [1991]. 19p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. topical conference on radio frequency power in plasmas; Charleston, SC (United States); 12-14 Aug 1991. Order Number DE92000050. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments have begun on D3-D using the fast wave current drive (FWCD) phased antenna array. The array consists of four elements with slotted septa between them to reduce mutual coupling. The passive phasing/matching circuit developed for the launcher incorporates only five tuning elements and is driven by a single rf power supply. The system has successfully operated in the presence of plasma at power levels up to 1.25 MW, with $\pi/2$ relative phasing, and approximately equal currents and voltages on all elements. Tuning algorithms that allow proper setting of all five elements within 1–2 shots have been developed. In addition, substantial modeling has been undertaken in support of the D3-D FWCD program. Loading calculations that take into account currents induced in the septa as well as other effects related to antenna geometry have been performed, and the results agree well with the observed data. A circuit model has been developed that, in combination with the loading calculations, allows the simulation of shot-to-shot matching for various tuning algorithms. 6 refs., 8 figs.

**35419** (CONF-910968–2) **Characteristics of an electron-beam rocket pellet accelerator.** Tsai, C.C.; Foster, C.A.; Milora, S.L.; Schechter, D.E. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000073. Source: OSTI; NTIS; INIS; GPO Dep.

A proof-of-principle (POP) electron-beam pellet accelerator has been developed and used for accelerating hydrogen and deuterium pellets. An intact hydrogen pellet was accelerated to a speed of 460 m/s by an electron beam of 13.5 keV. 0.3 A, and 2 ms. The maximum speed is limited by the acceleration path length (0.4 m) and pellet integrity. Experimental data have been collected for several hundred hydrogen pellets, which were accelerated by electron beams with parameters of voltage up to 16 kV, current up to 0.4 A, and pulse length up to 10 ms. Preliminary results reveal that the measured burn velocity increases roughly with the square of the beam voltage, as the theoretical model predicts. The final pellet velocity is proportional to the exhaust velocity, which increases with the beam power. To reach the high exhaust velocity needed for accelerating pellets to >1000 m/s, a new electron gun, with its cathode indirectly heated by a graphite heater and an electron beam, is being developed to increase beam current and power. A rocket casing or shell around the pellet has been designed and developed to increase pellet strength and improve the electron-rocket coupling efficiency. We present the characteristics of this pellet accelerator, including new improvements. 13 refs., 6 figs.

**35420** (CONF-910968–7) **The ion cyclotron heating (ICH) system for BPX.** Swain, D.W.; Yugo, J.J.; Williamson, D.E.; Batchelor, D.B.; Carter, M.D.; Goulding, R.H. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000426. Source: OSTI; NTIS; INIS; GPO Dep.

The ICH system is required to deliver at least 20 MW of rf power to the BPX plasma for pulse lengths of up to 15 s over a range of plasma operating conditions (e.g., average plasma densities from 0.5 to 4.5 x $10^{20}$ $m^{-3}$, toroidal fields from 5 to 8 T). The power must be delivered to the plasma over a range of frequencies corresponding to the different operating conditions. On the basis of calculations of the load resistance that the antennas will see because of the presence of the plasma, circuit analysis of the rf system indicates that the present ICH design should easily be able to deliver this amount of power to the plasma. Some research and development (R&D) must be done to provide a reliable system in the BPX radiation environment. 5 refs., 9 figs., 1 tab.

**35421** (CONF-910968–8) **Ex-vessel remote maintenance development plans for the Burning Plasma Experiment.** Burgess, T.W.; Davis, F.C. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000430. Source: OSTI; NTIS; INIS; GPO Dep.

Remote maintenance (RM) is fundamental to the basic design requirements of the Burning Plasma Experiment (BPX), and an extensive RM development and demonstration program is planned to meet these requirements. The program first draws from the experience base that exists in the fission community and Europe's Joint European Torus (JET) Project. Successful solutions are applied where possible and, in many cases, improved in order to achieve the performance demanded by a multiyear program that must be capable of efficiently executing RM procedures. Early, concurrent efforts in the design and fabrication of prototype remote handling (RH) equipment, remote tooling, and maintainable machine components will precede an extensive use of mock-up equipment in order to test, develop, and demonstrate the technology. 7 refs,. 5 figs.

**35422** (CONF-910968–10) **Scoping studies for small steady-state tokamaks for divertor testing.** Galambos, J.D.; Peng, Y.K.M.; Nelson, B.E.; Hirshman, S.P.; Fogarty, P.J. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000740. Source: OSTI; NTIS; INIS; GPO Dep.

A prime uncertainty in next-generation devices is the divertor performance. For the International Thermonuclear Experimental Reactor (ITER), the divertor limit often plays a more critical role in the operational scenario definition than do beta limit and energy confinement constraints. Hence, it is desirable to test the divertors in an environment as close as possible to that expected in next-step burning plasma experiments. Initial global scoping studies are done for small, steady-state, copper coil, beam-driven tokamaks that are dedicated to divertor testing. The usual ITER global physics models (beta limit, energy confinement, and analytic divertor heat load calculation) are incorporated, and for performance criteria we require that the divertor heat load and plasma collisionality in the edge region be similar to those expected in ITER. The smallest, lowest-cost devices satisfying these constraints tend to have major radius below 1 m, plasma current of 0.5 to 1 MA, and low aspect ratio and costs of a few tens of millions of dollars. Injection powers of about 4 to 5 MW are needed to sustain the plasma current, maintain plasma power balance, and provide the required divertor heat load. 6 refs., 5 tabs.

**35423** (CONF-910968–11) **ITER physics design guidelines at high aspect ratio.** Uckan, N.A. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000729. Source: OSTI; NTIS; INIS; GPO Dep.

The physics requirements for ITER design are formulated in a set of physics design guidelines. These guidelines, established by the ITER Physics Group during the Conceptual Design Activity (CDA, 1988–90), were based on credible extrapolations of the tokamak physics database as assessed during the CDA, and defined a class of tokamak designs (with plasma current I ~20 MA and aspect ratio A ~2.5–3.5) that meet the ITER objectives. Recent US studies have indicated that there may be significant benefits if the ITER-CDA design point is moved from the low aspect ratio, high current baseline (A = 2.79, I = 22 MA) to a high aspect ratio machine at A ~4, I ~15 MA, especially regarding steady-state, technology-testing performance. To adequately assess the physics and technology testing capability of higher aspect ratio design options, several changes are proposed to the original ITER guidelines to reflect the latest (although limited) developments in physics understanding at higher aspect ratios. The critical issues for higher aspect ratio design options are the uncertainty in scaling of confinement with aspect ratio, the variation of vertical stability with elongation and aspect ratio, plasma shaping requirements, ability to control and maintain plasma current and q-profiles for MHD stability (and volt-second consumption), access for current

drive, restrictions on field ripple and divertor plate incident angles, etc. 5 refs., 1 tab.

**35424** (CONF-910968–12) **Mechanical design issues associated with mounting, maintenance, and handling of an ITER divertor.** Goranson, P.L.; Fogarty, P.J.; Jones, G.H. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000742. Source: OSTI; NTIS; INIS; GPO Dep.

Several designs that address plasma-facing plate configurations and thermal-hydraulic design issues have been developed for the ITER divertor. Design criteria growing out of physics requirements, physical constraints, and remote handling requirements impose severe mechanical requirements on the support structure and its attachments. These pose a challenge to the mechanical design of a divertor, which must be addressed before a functional divertor is practical – that is, one that can be remotely handled, aligned, and maintained; that functions reliably under thermal loading and disruptions; and that gives the required life in the nuclear environment predicted for ITER. This paper discusses the design criteria for the divertor mounting structure and identifies the mechanical design issues that need to be addressed. Achieving the criteria may require the development of new components and innovative configurations, specifically a new class of remote fasteners and electrically resistant material for mounts. The possible design of such components and an R&D program to develop them are described, and issues specific to the high-aspect-ratio design (HARD) configuration are summarized. Analysis and experiments that will resolve these issues and concerns and lead to a final ITER design are identified. 2 refs., 2 figs.

**35425** (CONF-910968–13) **Plasma shape control calculations for BPX divertor design.** Strickler, D.J. (Oak Ridge National Lab., TN (United States)); Neilson, G.H.; Jardin, S.C.; Pomphrey, N. Oak Ridge National Lab., TN (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000731. Source: OSTI; NTIS; INIS; GPO Dep.

The Burning Plasma Experiment (BPX) divertor is to be capable of withstanding heat loads corresponding to ignited operation and 500 MW of fusion power for a current rise time and flattop lasting several seconds. The poloidal field (PF), diagnostic, and feedback equilibrium control systems must provide precise X-point position control in order to sweep the separatrices across the divertor target surface and optimally distribute the heat loads. A control matrix MHD equilibrium code, BEQ, and the Tokamak Simulation Code (TSC) are used to compute preprogrammed double-null (DN) divertor sweep trajectories that maximize sweep distance while simultaneously satisfying a set of strict constraints: minimum lengths of the field lines between the X-point and strike points, minimum spacing between the inboard plasma edge and the limiter, maximum spacing between the outboard plasma edge and the ICRF antennas, minimum safety factor, and linked poloidal flux. A sequence of DN diverted equilibria and a consistent TSC fiducial discharge simulation are used in evaluating the performance of the BPX divertor shape and possible modifications. 5 refs., 10 figs.

**35426** (CONF-910968–14) **Electromagnetic loads on ITER in-vessel components.** Williamson, D.E.; Conner, D.L.; Nelson, B.E.; Sayer, R.O.; Yugo, J.J. Oak Ridge National Lab., TN (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000672. Source: OSTI; NTIS; INIS; GPO Dep.

Design of the vacuum vessel and internal blanket/shield modules for the International Thermonuclear Experimental Reactor (ITER) is strongly influenced by the magnitude of electromagnetic loads due to plasma disruption. Calculations with the finite element code, EddyCuFF, have been performed to quantify these loads and incorporate them into the design process. A multifilament model of plasma motion and current decay has been developed using data generated by the Tokamak Simulation Code (TSC). Comparison with calculations employing single filament plasma models illustrates the need to use self-consistent, distributed plasma scenarios when analyzing toroidally segmented components. Application is made to design and analysis of the high aspect ratio design (HARD) option vessel and blanket/shield modules. Variations in geometry, response characteristics, and electromagnetic loads are compared to the reference design values. 5 refs., 8 figs., 4 tabs.

**35427** (CONF-910968–15) **Stress analysis of a double-wall vacuum vessel for ITER.** Conner, D.L.; Williamson, D.E.; Nelson, B.E. Oak Ridge National Lab., TN (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000681. Source: OSTI; NTIS; INIS; GPO Dep.

The preliminary structural analyses performed in support of the design of the vacuum vessel for the International Thermonuclear Experimental Reactor (ITER) are described. A thin, double-wall, all-welded structure is the proposed design concept analyzed. The results of the static stress analysis indicate the adequacy of such a structure. The effects of the proposed high-aspect-ratio design configuration on loading and stresses are also discussed. 4 refs., 6 figs., 1 tab.

**35428** (CONF-910968–16) **The effect of the high-aspect-ratio design parameters on ITER containment structures.** Nelson, B.E.; Conner, D.L.; Fogarty, P.J.; Jones, G.H.; Lousteau, D.C.; Williamson, D.E. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000736. Source: OSTI; NTIS; INIS; GPO Dep.

The containment structures for the International Thermonuclear Experimental Reactor (ITER) include the plasma vacuum vessel, the structural supports for the in-vessel components, the gravity supports for the vacuum vessel and magnet system, the passive stabilizing structure, the internal fast active coils, and the cryostat vacuum vessel. Reference design concepts for all of these components have been prepared as part of the ITER Conceptual Design Activity (CDA), for the standard ITER design point: Aspect ratio of 2.8, major radius of 6 m, central toroidal field of 4.8 T, and peak plasma current of 22 MA. A proposal has been made to improve the performance of ITER by modifying the reference design point. The high-aspect-ratio design (HARD) proposal increases the aspect ratio to 4, increases the central toroidal field to 7 T, and decreases the peak plasma current to 14.8 MA. Systems studies indicate that the HARD parameters provide improved technology testing capability by increasing the neutron wall loading while maintaining the CDA physics constraints (beta limit, energy confinement, etc.). Changes in configuration, loading, stresses, and other factors for the containment structures components, based on the HARD parameters, have been investigated. The effects of these changes, both positive and negative, are discussed. The primary considerations are: Does the HARD design meet all of the functional requirements? Does the HARD design resolve and/or reduce any of the technical problems inherent in the CDA design? Does the HARD design create and/or exacerbate any technical problems? Are cost savings associated with the HARD configuration?

**35429** (CONF-910968–17) **Design of a tritium pellet injector for TFTR.** Milora, S.L. (Oak Ridge National Lab., TN (United States)); Gouge, M.J.; Fisher, P.W.; Combs, S.K.; Cole, M.J.; Wysor, R.B.; Fehling, D.T.; Foust, C.R.; Baylor, L.R.; Schmidt, G.L.; Barnes, G.W.; Persing, R.G. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000737. Source: OSTI; NTIS; INIS; GPO Dep.

The TFTR tritium pellet injector (TPI) is designed to provide a tritium pellet fueling capability with pellet speeds in the 1– to 3 km/s-range for the TFTR D-T phase. The existing TFTR deuterium pellet injector is being modified at Oak Ridge National Laboratory to provide a fourshot, tritium-compatible, pipe-gun configuration with three upgraded single-stage pneumatic guns a two -stage light

gas gun driver. The pipe gun concept has been qualified for tritium operation by the tritium proof-of-principle injector experiments conducted on the Tritium Systems Test Assembly at Los Alamos National Laboratory. In these experiments, tritium and D-T pellets were accelerated to speeds near 1.5 km/s. The TPI is being designed for pellet sizes in the range from 3.43 to 4.0 mm in diameter in arbitrarily programmable firing sequences at speeds up to approximately 1.5 km/s for the three single-stage drivers and 2.5 to 3 km/s for the two-stage driver. Injector operation will be controlled by a programmable logic controller. 7 refs., 4 figs.

**35430** (CONF-910968–18) **BPX insulation irradiation program test results.** McManamy, T.J. (Oak Ridge National Lab., TN (United States)); Kanemoto, G.; Snook, P.G. Oak Ridge National Lab., TN (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92000739. Source: OSTI; NTIS; INIS; GPO Dep.

The toroidal field coil insulation for the Burning Plasma Experiment (BPX) is expected to receive a radiation dose of nearly $10^{10}$ rad and to withstand significant mechanical stresses. An irradiation test program was performed at the Idaho National Engineering Laboratory (INEL) using the Advanced Technology Reactor (ATR) for irradiations to doses on the order of $3 \times 10^{10}$ rad. The flexure and shear strength with compression of commercially procured sheet material were reported earlier. A second series of tests has been performed to slightly higher dose levels with vacuum impregnated materials, glass strand material, and Spaulrad-S sheet samples. Vacuum impregnation with a Shell 9405 resin and 9470 hardener was used to produce bonded copper squares and flexure samples of both pure resin and resin with S-glass. A new test fixture was developed to test the bonded samples in shear without applied compression. The Spaulrad-S flexure samples demonstrated a loss of strength with irradiation, similar to previous results. The pure resin lost nearly all flexibility, while the S-glass-reinforced samples retained between 30% and 40% of the initial flexure strength. The S-glass strands showed a 30% loss of strength at the higher dose level when tested in tension. The bonded copper squares had a low room-temperature shear strength of approximately 17 MPa before irradiation, which was unchanged in the irradiated samples. Shear testing of unirradiated bonded copper squares with ten different types of surface treatment revealed that the low shear strength resulted from the polyurethane primer used. In the later series of test, the epoxy-based primers and DZ-80 from Ciba-Geigy did much better, with shear strengths on the order of 40 MPa. These samples also demonstrated a resistance to cryogenic shock. One irradiated bonded sample was tested up 10 210 MPa in compression, the limit of the test fixture, without failure.

**35431** (CONF-910968–19) **Heating profiles on ICRF antenna Faraday shields.** Taylor, D.J.; Baity, F.W.; Hahs, C.L.; Riemer, B.W.; Ryan, P.M.; Williamson, D.E. Oak Ridge National Lab., TN (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 14. IEEE symposium on fusion engineering; San Diego, CA (United States); 30 Sep - 3 oct 1991. Order Number DE92001679. Source: OSTI; NTIS; INIS; GPO Dep.

A conceptual design for an uncooled Faraday shield for the BPX ion cyclotron resonance heating (ICRH) antenna, which should withstand the proposed long-pulse operation, has been completed. A high-heat-flux, uncooled Faraday shield has also been designed for the fast-wave current drive (FWCD) antenna on D3-D. For both components, the improved understanding of the heating profiles made it possible to design for heat fluxes that would otherwise have been too close to mechanically established limits. The analytical effort is described in detail, with emphasis on the design work for the BPX ICRH antenna conceptual design and for the replacement Faraday shield for the D3-D FWCD antenna. Results of analyses are shown, and configuration issues involved in component modeling are discussed. 3 refs., 6 figs., 2 tabs.

**35432** (CONF-9110231–1) **Potential improvements to ENDF/B-VI for fusion data.** Larson, D.C.; Fu, C.Y. Oak Ridge National Lab., TN (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Topical conference on nuclear data for fusion reactor technology; Karlsruhe (Germany); 23 Oct 1991. Order Number DE92000435. Source: OSTI; NTIS; INIS; GPO Dep.

While ENDF/B-6 is significant improvement over previous versions for fusion reactor design calculations, several areas have not received attention and may need improvement. In addition, broadening of the contents of the evaluations to contain information not easily derived at present should be considered. 11 refs.

**35433** (CONF-911111–2) **Anisotropic dislocation loop nucleation in ion-irradiated $MgAl_2O_4$.** Zinkle, S.J. Oak Ridge National Lab., TN (United States). [1991]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on fusion reactor materials; Clearwater, FL (United States); 17-22 Nov 1991. Order Number DE92001681. Source: OSTI; NTIS; INIS; GPO Dep.

Polycrystalline disks of stoichiometric magnesium aluminate spinel ($MgAl_2O_4$) were irradiated with 2 MeV $Al^+$ ions at 650°C and subsequently analyzed in cross-section using transmission electron microscopy (TEM). Interstitial dislocation loops were observed on 110 and 11 habit planes. The population of loops on both sets of habit planes was strongly dependent on their orientation with respect to the ion beam direction. The density of loops with habit plane normals nearly perpendicular to the ion beam direction much higher than loops with habit plane normals nearly parallel to the ion beam direction. On the other hand, the loop size was nearly independent of habit plane orientation. This anisotropic loop nucleation does not occur in ion-irradiated metals such as copper. An additional anomaly associated with ion-irradiated spinel is that the loops on 111 planes were partially unfaulted with a Burgers vector of $b = a/4\langle 110 \rangle$. Previous neutron irradiation studies have never reported unfaulted loops in stoichiometric spinel. Possible cause of the unusual response of spinel to ion irradiation are discussed. 12 refs., 14 figs.

**35434** (CONF-911240–1) **Recent progress in the development of materials for fusion reactors.** Bloom, E.E.; Rowcliffe, A.F. Oak Ridge National Lab., TN (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. Japan international Society for the Advancement of Material and Process Engineering (SAMPE) symposium and exhibition; Chiba (Japan); 11-14 Dec 1991. Order Number DE91016283. Source: OSTI; NTIS; INIS; GPO Dep.

Development of materials with suitable properties is essential if fusion is to be realized as an economic, safe, and environmentally acceptable energy source. For each of the major reactor systems (e.g., superconducting magnets, blankets, divertors, auxiliary heating, and diagnostic devices), material requirements have been defined and alloy and ceramic systems, which have attractive properties for the various applications, have been identified. The next experimental fusion reactor, the International Thermonuclear Experimental Reactor (ITER), will utilize existing materials technology. However, for many applications in power reactors, existing materials do not have adequate properties and advanced materials must be developed. This paper presents an overview of the status of materials technology in four key areas: structural materials for the first wall and blanket (FWB), plasma-facing materials, materials for superconducting magnets, and ceramics for electrical and structural applications. 7 refs.

**35435** (DOE/DP/40200–166) **LLE review quarterly report, April–June 1991: Volume 47.** Jaanimagi, P.A. (ed.). Rochester Univ., NY (United States). Lab. for Laser Energetics. [1991]. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC03-85DP40200. Order Number DE91018828. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This volume of the LLE Review, covering the period April–June 1991, contains articles on the production and characterization of hot, long-scale-length laser plasmas, a new x-ray spectroscopic method for diagnosing laser-driven target implosions, and two-dimensional (2-D) simulation results that confirm the dominance of kinetic thermal filamentation over ponderomotive filamentation. The section on advanced technology includes a report on the time-domain characterization of bent coplanar waveguides, and a study of the surface disordering of Pb(100) at temperatures below the bulk-melting temperature. Finally, the activities of the National

Laser Users Facility and the GDL and OMEGA laser facilities are summarized.

**35436** (DOE/ER/52122–6) **High-power microwave transmission systems for electron-cyclotron-resonance plasma heating: Progress report, September 1, 1990–August 31, 1991.** Vernon, R.J. Wisconsin Univ., Madison, WI (United States). Dept. of Electrical and Computer Engineering. Aug 1991. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER52122. Order Number DE92000020. Source: OSTI; NTIS; INIS; GPO Dep.

This progress report is for the sixth year of a grant from the US Department of Energy for the design, development, and fabrication of ECRH transmission and mode conversion systems to transport microwave power from a gyrotron to a magnetically confined plasma. The design and low-power testing of new and improved components for such systems and development of underlying theory is the focus of this project. Devising and improving component testing and diagnostic techniques is also an important part of this effort. The development of possible designs for sections of gyrotrons themselves, such as tapers or Vlasov-type launchers, in support of the Varian gyrotron development program is also considered when appropriate. We also provide support to other groups working on ECR heating of magnetically confined plasmas such as the groups at General Atomics, the University of Texas at Austin, and Lawrence Livermore National Laboratory. During the last year, we designed and had fabricated a two-dimensional Vlasov antenna system for a 110 GHz $TE_{15,2}$ mode gyrotron for possible use at General Atomics. The system included the launcher section, a visor, main reflector, and focusing reflector. Programs to generate the tool-path profiles to cut the "General Atomics" Vlasov components on a milling machine were developed. We have also developed state-of-the art theory and programs for three-dimensional whispering-gallery-mode Vlasov antenna systems. A design for a 110 GHz $TE_{01}$-$TE_{15,2}$ mode converter system for cold testing WGM Vlasov antenna systems was developed and is currently being fabricated also.

**35437** (DOE/ER/52127–81) **CTR plasma engineering studies: Annual progress report, 1 December 1990–30 November 1991.** Miley, G.H. Illinois Univ., Urbana, IL (United States). Fusion Studies Lab. [1991]. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER52127. Order Number DE92000761. Source: OSTI; NTIS; INIS; GPO Dep.

Ash (e.g. thermalized helium from D-T) buildup in a tokamak can potentially prevent ignition and seriously degrade the fusion energy gain from driven system. This problem is most pronounced as the ratio of particle/energy confinement time increases towards the neoclassical limit. Yet much improved confinement of the fuel ions is desirable for a fusion reactor. The goals of the work described here were two fold: to study the effect of helium buildup on the energy balance for a tokamak, and consider methods of active control that might be employed to alleviate the problem. We examine ash buildup effect for both D-T and D-$^3$He systems. Most examples used apply to the ARIES 1 D-T reactor design and to the ARIES 3 D-$^3$He design since part of this was in support of these two designs. Then we report on brief studies of two potentially attractive control methods, namely controlled sawtooth and fishbone instabilities. The concept is that sawteeth or fishbones would be used on purpose periodically in order to "flush" out excess ash from the fusion core. Both methods are shown to feasible and attractive. More study is needed, however, since the phenomenona in which are physically complex. Still the pay off, namely, reduced ash buildup, is exceedingly important so that such studies desires strong attention.

**35438** (EGG-FSP–9789) **Trapping effects on diffusion transients.** Longhurst, G.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jul 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE91018717. Source: OSTI; NTIS; INIS; GPO Dep.

Trapping in a material subject to a diffusion-driven permeation transient can cause a substantial alteration of the shape and time scale of the transient. This happens because the filling and subsequent emptying of the trap sites causes a perceptible delay in movement of the diffusing species through the material. By studying the shape and temperature sensitivity of permeation transients, it is possible to learn something about the nature of the traps. In this report I have undertaken to show the relationship of the permeation transients under various assumptions about the traps to those when no trapping is operative. One limit assumes that traps are only partially filled. In that case the transient has all the characteristics of a classical nontrapping permeation transient, but the time constant is extended by a quantity that depends on material properties and temperature along. In another limit, all the traps are assumed to be filled locally before diffusion takes the solute past the region of trap filling. In that case the transient is governed by geometric effects. Other cases will be intermediate to these two limits. I have defined a trapping parameter that characterizes the effect of traps on the apparent diffusion time constant and a discriminant that indicates which limit should dominate. 1 ref., 3 figs.

**35439** (ENEA-RTI-INN–91-04) **ANABASI code for thermo-mechanical behaviour of BIT breeder pellet.** Cosoli, G. ENEA, Casaccia (Italy). Area Energia e Innovazione. 1991. 35p. (In Italian). (RTI-INN–91-04). Order Number DE92705889. Source: OSTI; NTIS (US Sales Only).

Originally written to define the in-pile behaviour of a fission bar, the ANABASI code was modified to reflect the construction and performance characteristics of a BIT breeder pellet - 316 L steel sheath containing gamma-Li - aluminium oxide. The principle modifications regarded the code's ability to characterize the pellet's structural materials and calculate the deformations and stresses induced by a temperature gradient. The routines for the execution of the iterative calculations remained essentially unchanged with respect to the fission version of the code. In its present form, the code does not take into consideration time dependent phenomena for which case a 'life start' behavioural model is necessary. In its general application, the mechanical model can be applied to elastic regime calculations of deformations and stresses generated within any finite-height cylinder by a temperature gradient.

**35440** (GA-A–20624) **A system to deposit boron films (boronization) in the DIII-D tokamak.** Hodapp, T.R. (General Atomics, San Diego, CA (United States)); Jackson, G.L.; Phillips, J.; Holtrop, K.L.; Petersen, P.I.; Winter, J. General Atomics, San Diego, CA (United States). Sep 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-910968–6: 14. IEEE symposium on fusion engineering, San Diego, CA (United States), 30 Sep - 3 oct 1991). Order Number DE92000288. Source: OSTI; NTIS; INIS; GPO Dep.

A system has been added to the D3-D tokamak to coat its plasma facing surfaces with a film of boron using diborane gas. The system includes special health and safety equipment for handling the diborane gas which is toxic and inflammable. The purpose of the boron film is to reduce the levels of impurity atoms in the D3-D plasmas. Experiments following the application of the boron film in D3-D have led to significant reductions in plasma impurity levels and the observation of a new, very high confinement regime. 9 refs., 1 fig.

**35441** (GA-A–20627) **110 GHz ECH heating system for DIII-D.** Callis, R.; Cary, W.; Moeller, C.; Freeman, R.; Prater, R.; Remsen, D.; Sevier, L. General Atomics, San Diego, CA (United States). Aug 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-910869–6: 9. topical conference on radio frequency power in plasmas, Charleston, SC (United States), 12-14 Aug 1991). Order Number DE91018732. Source: OSTI; NTIS; INIS; GPO Dep.

Electron cyclotron heating (ECH) has been demonstrated to be effective at heating tokamak plasmas in DIII-D and other tokamaks. Extension of these results to high frequency and higher power in DIII-D is planned using 110 GHz outside launch X-mode at the second harmonic. A 2 MW system constructed from four modules, each using a Varian 0.5 MW 110 GHz gyrotron, is scheduled to be completed by May 1992; construction of a complete 0.5 MW module is complete and is in checkout. The results of the engineering test will be reported. A unique feature of this design is the use of strongly guided $HE_{11}$ modes to transmit the power over the long distances required. The choice of a strongly guided $HE_{11}$ mode for

transmitting the ECH power was influenced by the compact waveguide, the non-critical alignment which allows waveguide flex, the ability to use mode selective directional couplers, and finally, continuous curvature bends can be used since there are no trapped modes. The waveguide is evacuated to handle the required power density. Implementation of this design required the development of mode converters to convert from the $TE_{15,2}$ mode generated by the gyrotron to the desired $HE_{11}$. Results of the high power tests of the mode converters and transmission components will be presented. 2 refs., 1 fig.

**35442** (HMI-B–467) **Interactions of hydrogen with graphite at low pressure and elevated temperature.** Hoinkis, E. Hahn-Meitner-Institut Berlin GmbH (Germany). Mar 1991. 76p. Order Number DE92714326. Source: OSTI; NTIS (US Sales Only); INIS.

The plasma facing components of the vacuum chamber for thermonuclear fusion experiments are clad with graphite. Recycling of gases affects the plasma properties, and the tritium quantity accumulated in the graphite during the operation of Tokamaks with DT must be known. An adsorption isotherm for deuterium on the nuclear grade graphitic Matrix A3-3 was measured by using a volumetric method at 1173 K at pressures < 130 Pa. The data obey a Langmuir type isotherm for dissociative adsorption. The saturation concentration is 140 appm. The adsorption energy at 0 K was estimated as $E_c$ = 2.5 eV/$D_2$ using Fowler's equation and isotherms were calculated for this $E_c$ value. These isotherms predict saturation of the adsorption sites in graphite at T < 700 K and $P_{D2} > 0.1$ Pa. At T > 1173 K and $P_{D2} < 10^{-2}$ Pa the adsorbed quantity is less than 1% of the saturation level. The release kinetics of deuterium was measured at temperatures uo to 2000 K. $D_2$ desorption commenced at 1170 K. The maximum of the release rate is observed at $T_p$ = 1770 K. A Lennard-Jones potential energy diagram was calculated, which suggests a C-H bond energy $E_b \simeq 3.4$ eV/D and an activation energy of desorption $E_d \simeq 4$ eV/$D_2$. The partial pressures of hydrocarbons $C_n$ $_{\leq 3}$ $H_m$ in equilibrium with graphite were calculated. At total pressures < $10^{-2}$ Pa the partial pressures of these hydrocarbons are less than $10^{-7}$ Pa in the temperature range 600-1500 K. (orig./MM).

**35443** (IAEA-TECDOC–572, pp. 53-64) **"Low-activation" fusion materials development and related nuclear data needs.** Cierjacks, S. (KfK-Euratom Association, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). International Atomic Energy Agency, Vienna (Austria). Oct 1990. (CONF-8909234–: Advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna (Austria), 19-22 Sep 1989). In *Nuclear data for radiation damage assessment and related safety aspects 1989: Proceedings of an advisory group meeting held in Vienna, 19-22 September 1989.* 193p. Order Number DE92601383. Source: OSTI; NTIS (US Sales Only); INIS.

So-called "low-activation" materials are presently considered as an important means of improving the safety characteristics of future DT fusion reactors. Essential benefits are expected in various problem areas ranging from operation considerations to aspects of decommissioning and waste disposal. Present programs on "low-activation" materials development depend strongly on reliable activity calculations for a wide range of technologically important materials. The related nuclear data requirements and important needs for more and improved nuclear data are discussed. (author). 32 refs, 4 figs, 4 tabs.

**35444** (IAEA-TECDOC–572, pp. 45-52) **Measurement of long-lived isotopes and helium production in fusion materials.** Greenwood, L.R. (Argonne National Lab., IL (USA)). International Atomic Energy Agency, Vienna (Austria). Oct 1990. Contract W-31-109-Eng-38. (CONF-8909234–: Advisory group meeting on nuclear data for radiation damage assessment and related safety aspects, Vienna (Austria), 19-22 Sep 1989). In *Nuclear data for radiation damage assessment and related safety aspects 1989: Proceedings of an advisory group meeting held in Vienna, 19-22 September 1989.* 193p. Order Number DE92601383. Source: OSTI; NTIS (US Sales Only); INIS.

Results are summarized for measurements of the production rates for long-lived radioisotopes and helium in fusion reactor materials. Measurements have been performed at T(d,n) generators, near 14 MeV; at broad-spectrum Be(d,n) accelerator-based neutron fields; and in various fission reactors. These activation data are used to predict the production of these isotopes in fusion reactor materials for waste disposal and maintenance applications. Helium data are needed for the simulation of fusion materials damage in fission reactor irradiations and as a stable product dosimeter. Nuclear data needs and future plans are discussed. (author). 20 refs, 5 figs, 4 tabs.

**35445** (IPP–1/260) **ASDEX-upgrade poloidal field coils. Specifications, load, stress. Pt. 1.** Pillsticker, M.; Werner, F. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Apr 1991. 118p. (In German). Order Number DE92714328. Source: OSTI; NTIS (US Sales Only); INIS.

The pulsed and irregular load of the ASDEX-Upgrade poloidal field coils postulates a careful analysis of the maximum stresses in order to find out the criteria for specifications and supervision. For operating conditions known at the time of coil design, maximum stresses and loads are compiled and the resulting features and limitations of coil operation are explained. (orig.).

**35446** (IPP–5/40) **An ablation rate model for time-dependent pellet ablation studies at Max-Planck-Institute.** Parks, P.B. (General Atomics Co., San Diego, CA (USA)). Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). Jun 1991. 17p. Order Number DE92714338. Source: OSTI; NTIS (US Sales Only); INIS.

The ablation cloud of a pellet injected into a plasma consists of two fairly distinct regions: (1) a cold, dense, weakly ionized core region, whose expansion is spherically symmetric and (2) a warm plasma outer region which forms an elongated channel parallel to B vector. The core region is transonic; The pellet mass ablation rate depends only on the attenuation by the total $\int$ ndl in the outer region. The quasi-steady 'fast' core region provides a particle source for the more slowly evolving outer region, described using a time-dependent model under development at IPP-Garching. By joining the two regions a self-consistent ablation model can be constructed for refuelling studies on fusion grade plasmas. (orig.).

**35447** (JAERI-M–91-048) **Study on particle transport to wall in JFT-2M edge plasma by accelerator-based analysis.** Nakajima, Tadashi (Kobe Univ. of Mercantile Marine (Japan)); Takaya, Izumi; Akiyama, Takeshi; Kitamura, Akira; Yano, Syukuro; Sengoku, Seio; Ohtsuka, Hideo; Maeda, Hikosuke. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1991. 67p. (In Japanese). Order Number DE92704084. Source: OSTI; NTIS (US Sales Only); INIS.

Transport of hydrogen-isotope particles, D and H, in the scrape-off layer (SOL) of JFT-2M having S.S.304 wall (partially covered with carbon ~ 40%) was studied using an accelerator-based collector probe method. Here irradiation conditions were provided with the Taylor discharge cleaning (TDC) and the ohmically heated discharge (OHD) with or without neutral beam injection (NBI). First, effects of the wall on TDC-particle transport were examined with Si probes in the D-OHD after the $D_2$-(or $H_2$-)TDC; some of the D(or H) particles absorbed in the wall in the preceding $D_2$-(or $H_2$-)TDC are recycled in the subsequent OHD to reach the plasma boundary through the SOL. This effect was also confirmed in another experiment; in the $H_2$-TDC followed by the D-OHD the H/D fluence ratio distribution is found to increase toward the wall, indicating that some of the H particles due to the $H_2$-TDC are recycled from the wall to join the SOL plasma. Next, we measured the effect of high-fluence $H_2$-TDC particles on the H retention of two C probes (C: Type AX-650K of Toyo Carbon Co., which is the same as JFT-2M divertor-plate material). In spite of the same H fluence (~6 x $10^{20}$ $cm^{-2}$) the retention of a sample having the smooth surface reached a saturated level of 5.44 x $10^{17}$ $cm^{-2}$ while that of the other sample having the rough surface (as made) was in an unsaturated region (1.6 x $10^{17}$ $cm^{-2}$), suggesting an importance of the surface condition. Finally, it becomes evident from the C-probe experiment in the $D_2$->$H_2$ (or $H_2$->$D_2$) TDC that some of the D(or H) particles absorbed in C during the preceding $D_2$-(or $H_2$-) TDC are replaced

'partially' by the H(or D) particles entering during the subsequent $H_2$-(or $D_2$-) TDC even under the 'unsaturated' condition. (J.P.N.).

**35448** (JAERI-M–91-080) **Japanese contributions to containment structure, assembly and maintenance and reactor building for ITER.** Shibanuma, Kiyoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Honda, Tsutomu; Kanamori, Naokazu. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1991. 367p. Order Number DE92704286. Source: OSTI; NTIS (US Sales Only); INIS.

Joint design work on Conceptual Design Activity of International Thermonuclear Experimental Reactor (ITER) with four parties, Japan, the United States, the Soviet Union and the European Community began in April 1988 and was successfully completed in December 1990. In Japan, the home team was established in wide range of collaboration between JAERI and national institute, universities and heavy industries. The Fusion Experimental Reactor (FER) Team at JAERI is assigned as a core of the Japanese home team to support the joint Team activity and mainly conducted the design and R and D in the area of containment structure, remote handling and plant system. This report mainly describes the Japanese contribution on the ITER containment structure, remote handling and reactor building design. Main areas of contributions are vacuum vessel, attaching locks, electromagnetic analysis, cryostat, port and service line layout for containment structure, in-vessel handling equipment design and analysis, blanket handling equipment design and related short term R and D for assembly and maintenance, and finally reactor building design and analysis based on the equipment and service line layout and components flow during assembly and maintenance. (author).

**35449** (JAERI-M–91-081) **Concept study of the Steady State Tokamak Reactor (SSTR).** Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1991. 632p. Order Number DE92713919. Source: OSTI; NTIS (US Sales Only); INIS.

The Steady State Tokamak Reactor (SSTR) concept has been proposed as a realistic fusion power reactor to be built in the near future. An overall concept of SSTR is introduced which is based on a small extension of the present day physics and technologies. The major feature of SSTR is the maximum utilization of a bootstrap current in order to reduce the power required for the steady state operation. This requirement leads to the choice of moderate current (12 MA), and high $\beta p$ (2.0) for the device, which are achieved by selecting high aspect ratio (A=4) and high toroidal magnetic field (16.5 T). A negative-ion-based neutral beam injection system is used both for heating and central current drive. Notable engineering features of SSTR are: the use of a uniform vacuum vessel and periodical replacements of the first wall and blanket layers and significant reduction of the electromagnetic force with the use of functionally gradient material. It is shown that a tokamak machine comparable to ITER in size can become a power reactor capable of generating about 1 GW of electricity with a plant efficiency of $\approx$30%. (author).

**35450** (JAERI-M–91-089) **Conceptual design and technology development of containment structure in Fusion Experimental Reactor (FER).** Nishio, Satoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Sato, Keisuke; Matsuoka, Fushiki; Kanamori, Naokazu; Koizumi, Koichi; Abe, Tetsuya; Hosobuchi, Hideo; Tada, Eisuke; Yamada, Masao. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1991. 145p. (In Japanese). Order Number DE92704100. Source: OSTI; NTIS (US Sales Only); INIS.

A conceptual design of FER (Fusion Experimental Reactor) containment structure and its associated R and D activities, conducted from '89 to '90, are described. The FER containment structure system which mainly consists of a vacuum vessel, shielding structures, in-vessel replaceable components, ports, a cooling pipe system, has been developed to fullfil the required function. As an initial stage of R and D activities, the elemental technologies common to a tokamak reactor have been developed. Among them, a locking mechanism for supporting in-vessel replaceable components and a technique for insulation/conduction are described. For the locking mechanism, a caulking cotter driven by hydraulic pressure has been employed. Three kinds of hydraulic driving mechanism have been manufactured by trial: a 'piston jack' type, a 'bellows' type and a 'flexible tube' type. In the latter type, the stroke is obtained by changing the cross section of the flexible tube from a flat racetrack shape to a fat shape by hydraulic pressure. As the result of preliminary performance test, the shape of 'flexible tube' has been found to be improved. For the insulation coating, $Al_2O_3$ has been selected as the material and a plasma spray method has been applied as the coating procedure. For the conduction coating, $Cr_3C_2$ has been selected as the material and JET-KOTE method has been applied as the coating procedure. Both methods have been successfully developed and have been confirmed to be applicable the actual machine. A one fifth scale model has been fabricated in order to verify the design feasibility, mainly geometrical consistency. Then some design modifications were found to be needed for some of the components based on the manufacturing experience. (author).

**35451** (JAERI-M–91-109) **Revised graphs of activation data for fusion reactor applications.** Seki, Yasushi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kawasaki, Hiromitsu; Yamamuro, Nobuhiro; Iijima, Shungo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1991. 317p. Order Number DE92704288. Source: OSTI; NTIS (US Sales Only); INIS.

Activation data are required for calculation of induced activity in a fusion reactor. This report gives in graphical form, the activation data which have been evaluated based on recent measurements and calculations, for use in the activation calculation code system THIDA-2. It shows transmutation and decay chain data, activation cross sections and decay gamma-ray emission data for 152 nuclides of interest in terms of fusion reactor design. This report is an updated and enlarged version of a similar report compiled in 1982 for the activation data of 116 nuclides, which had been shown to be extremely effective in referring the activation data and in locating and correcting inappropriate data. (author).

**35452** (KEK–90-15, pp. 277-287) **Application of spin-polarized fuel to fusion reactions.** Wakuta, Y. (Kyushu Univ., Fukuoka (Japan). Faculty of Engineering); Nakao, Y.; Honda, T.; Honda, Y.; Nakashima, H. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Nov 1990. (CONF-900289–: RCNP cyclotron cascade workshop on polarized ion sources and gas jets for nuclear physics at an intermediate energy, Tsukuba-Shi (Japan), 12-17 Feb 1990). In *Proceedings of the international workshop on polarized ion sources and polarized gas jets.* 393p. Order Number DE91780384. Source: OSTI; NTIS (US Sales Only); INIS.

Studies on the application of the polarized fuel to the inertial fusion reaction have been carried out. It is shown that the use of the spin-polarized fuel D vectorcenter dotT vector or D vectorcenter dot$^3$(He)vector reduces the irradiating laser power more than 50% compared with the use of the unpolarized fuel. The depolarization rate of the polarized fuel during the fusing process is found to be almost negligible. (author).

**35453** (LA-UR–91-2876) **Richtmyer-Meshkov instability of shocked gaseous interfaces.** Benjamin, R.F. (Los Alamos National Lab., NM (United States)); Besnard, D.; Haas, J.F. Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9107138–3: 18. international symposium on shock waves, Sendai (Japan), 21-26 Jul 1991). Order Number DE92000308. Source: OSTI; NTIS; GPO Dep.

The instability of shocked and reshocked perturbed interface between gases of different densities is analyzed by comparing flow visualization from 2D and 3D shock-tube experiments with 2D numerical simulations and theory. The shadowgraphs and calculations show similar large scales of mixing by fluid interpenetration induced by the Richtmyer-Meshkhov instability. In 2D, experimental instability growth following acceleration by the initial shock is less than calculated by linear theory or simulated. The 3D experiments are approximately simulated by 2D calculations with an increased initial amplitude of the interface. The kinetic energy of the interpenetrating velocity field from the simulations are also compared to a theoretical estimate derived from the linear theory. 2 refs., 10 figs.

**35454** (LA-UR–91-3017) **Tritium retention in jet cryopanel samples.** Walthers, C.R. (Los Alamos National Lab., NM (United

States)); Jenkins, E.M.; Mayaux, C.; Obert, W. Los Alamos National Lab., NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910920–4: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92000205. Source: OSTI; NTIS; INIS; GPO Dep.

The possibility that tritium might exchange with water trapped in aluminum anodize cryopanels in JET prompted a test program at the Tritium Systems Test Assembly, TSTA, Los Alamos, New Mexico. JET furnished two test pieces of cryopanel which were exposed to tritium at approximately liquid nitrogen temperature and 25 torr pressure for nearly two weeks. One specimen was removed and the retained tritium was measured. The second specimen was subjected to several increasing temperature vacuum bakeouts and the effectiveness of the bakeouts were inferred from the pressure history of the chamber. When the retained tritium in the second specimen was measured it was found that nearly 95% of the tritium, as measured in the first specimen, had been removed during the vacuum bakeouts. If the tritium retained in the cryopanel without bakeout were scaled to JET conditions according to a linear pressure time relationship, the tritium expected to become trapped in the JET cryopanels would be approximately 0.6 gram. Testing is currently underway at TSTA which will determine the tritium retention to be expected under more realistic JET operating conditions and which will assess the effectiveness of various bake or purge schemes in removing the trapped tritium. 2 refs., 2 figs.

**35455** (LA-UR–91-3019) **Overview of the Los Alamos National Laboratory Inertial Confinement Fusion Program.** Harris, D.B. Los Alamos National Lab., NM (United States). [1991]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9106182–3: Annual meeting and symposium of the Fusion Power Associates, Princeton, NJ (United States), 25-26 Jun 1991). Order Number DE92000199. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos Inertial Confinement Fusion (ICF) Program is focused on preparing for a National Ignition Facility. Target physics research is addressing specific issues identified for the Ignition Facility target, and materials experts are developing target fabrication techniques necessary for the advanced targets. We are also working with Lawrence Livermore National Laboratory on the design of the National Ignition Facility target chamber. Los Alamos is also continuing to develop the KrF laser-fusion driver for ICF. We are modifying the Aurora laser to higher intensity and shorter pulses and are working with the Naval Research Laboratory on the development of the Nike KrF laser. 9 refs., 1 fig., 2 tabs.

**35456** (LA-UR–91-3029) **Neutron flux enhancement at LASREF.** Sommer, W.F.; Ferguson, P.D.; Wechsler, M.S. Los Alamos National Lab., NM (United States). [1991]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-911111–1: International conference on fusion reactor materials, Clearwater, FL (United States), 17-22 Nov 1991). Order Number DE92000196. Source: OSTI; NTIS; INIS; GPO Dep.

The accelerator at the Los Alamos Meson Physics Facility produces a 1-mA beam of protons at an energy of 800 MeV. Since 1985, the Los Alamos Spallation Radiation Effects Facility (LASREF) has made use of the neutron flux that is generated as the incident protons interact with the nuclei in targets and a copper beam stop. A variety of basic and applied experiments in radiation damage and radiation effects have been completed. Recent studies indicate that the flux at LASREF can be increased by at least a factor of ten from the present level of about 5 E+17 $m^{-2}s^{-1}$. This requires changing the beam-stop material from Cu to W and optimizing the geometry of the beam-target interaction region. These studies are motivated by the need for a large volume, high energy, and high intensity neutron source in the development of materials for advanced energy concepts such as fusion reactors. 18 refs., 7 figs., 2 tabs.

**35457** (LA-UR–91-3114) **Tritium technology programs in the United States.** Anderson, J.L. Los Alamos National Lab., NM (United States). [1991]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910920–5: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 30 Sep - 4 oct 1991). Order Number DE92000172. Source: OSTI; NTIS; INIS; GPO Dep.

Tritium technology in the United States has advanced considerably since the 1988 Tritium Conferences in Toronto. This advance has come in facilities, processing and safety related technologies and in an ever increasing commitment to compliance related issues. The major laboratories in the US tritium programs continue to be (Westinghouse) Savannah River Site, EG&G Mound, Lawrence Livermore National Laboratory, Sandia National Laboratory and the Los Alamos National Laboratory. Each of these Laboratories have made some significant changes in their programs and/or facilities in the past four years. 11 refs, 1 fig.

**35458** (LA-UR–91-3115) **Improved KrF laser design for the Laboratory Microfusion Facility.** Harris, D.B.; Sullivan, J.A.; Pendergrass, J.H.; Kurnit, N.A.; Rose, E.A.; McLeod, J. Los Alamos National Lab., NM (United States). [1991]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910968–4: 14. IEEE symposium on fusion engineering, San Diego, CA (United States), 30 Sep - 3 oct 1991). Order Number DE92000171. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A conceptual design of the KrF laser-driven Laboratory Microfusion Facility (LMF) has been completed. LASNEX calculations predict an indirect-drive target yield of 400 MJ from the 3-MJ, 480-beam driver system. Nine final amplifiers with individual output energy of 412 kJ are used. The total cost of the KrF laser-driven LMF is estimated by an independent cost assessment to be $921 million in 1992 dollars. 12 refs., 7 figs., 3 tabs.

**35459** (LA-UR–91-3130) **An algorithm for determining EF coils from fixed-boundary equilibria applied to ARIES III.** Bathke, C. (Los Alamos National Lab., NM (United States)); Jardin, S.C.; Kessel, C.E. Los Alamos National Lab., NM (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-910968–3: 14. IEEE symposium on fusion engineering, San Diego, CA (United States), 30 Sep - 3 oct 1991). Order Number DE92000170. Source: OSTI; NTIS; INIS; GPO Dep.

An algorithm that determines the external EF coils required to produce equilibria calculated by high-resolution, fixed-boundary codes is described. The algorithm permits the specification of the poloidal-field-null location. The EF-coil positions on a specified surface located just outside of the TF coils are optimized to minimize the stored magnetic energy. Results of the application of this algorithm to ARIES-3 are also presented. 7 refs., 2 figs., 2 tabs.

**35460** (LBL–30748) **Heavy Ion Fusion Accelerator Research (HIFAR): Half-year report, October 1, 1990–March 31, 1991.** Lawrence Berkeley Lab., CA (United States). Apr 1991. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–509). Order Number DE92000655. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: emittance variations in current-amplifying ion induction lina; transverse emittance studies of an induction accelerator of heavy ions; drift compression experiments on MBE-4 and related emittance; low emittance uniform-density $C_{s}+$ sources for heavy ion fusion accelerator studies; survey of alignment of MBE-4; time-of-flight dependence on the MBE-4 quadrupole voltage; high order calculation of the multiple content of three dimensional electrostatic geometries; an induction linac injector for scaled experiments; induction accelerator test module for HIF; longitudinal instability in HIF beams; and analysis of resonant longitudinal instability in a heavy ion induction linac.

**35461** (NIFS–84) **Development of the stellarator/heliotron research.** Iiyoshi, A. National Inst. for Fusion Science, Nagoya (Japan). May 1991. 30p. Order Number DE92713935. Source: OSTI; NTIS (US Sales Only); INIS.

The author reviewed the history of the development of the stellarator/heliotron system, and pointed out the important role of the radial electric field in plasma transport in helical devices. (J.P.N.).

**35462** (NIFS-PROC–5, pp. 1-10) **Rayleigh-Taylor Instability in LIB ICF.** Kawata, Shigeo (Nagaoka Univ. of Technology, Niigata

(Japan)): Sato, Toshiaki; Teramoto, Takayuki. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

The Rayleigh-Taylor(R-T) instability is studied in the Light-Ion-Beam(LIB) Inertial-Confinement-Fusion(ICF)-pellet. The R-T instability is one of the problems in ICF. The nonuniform acceleration field and the radiation effects on the LIB-ICF-pellet implosion are investigated by the linear analyses in this paper. By means of these analyses we obtained the following two results: 1) The nonuniform acceleration field in space does not change the growth rate ($\gamma$) of the R-T instability. However this nonuniformity may suppress the R-T instability in some particular cases. 2) The radiation may reduce the growth rate($\gamma$). (author).

**35463** (NIFS-PROC–5, pp. 11-19) **Two-stage ion diode experiments on induction adder.** Miyamoto, S. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering); Yasuda, Y.; Yamamoto, M. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

Two-stage ion diode experiment has been performed on an induction adder accelerator 'Reiden-SHVS'. The second stage diode is operated in an ion beam injection mode. Enhanced space-charge-limited current in second stage diode indicates a formation of virtual anode due to the energetic ion beam injection. The beam deflection by virtual anode formation occurred only at inner part of the beam. Two-stage charge-stripping ion diode is demonstrated. Carbon beam of $C^{+}$ and $C^{2+}$ are stripped and partially recombined in thin stripping foil and accelerated at second diode. (author).

**35464** (NIFS-PROC–5, pp. 45-57) **Theoretical study of 'Plasma Focus Diode'.** Jiang, Weihua (Nagaoka Univ. of Technology, Niigata (Japan)); Masugata, Katsumi; Yatsui, Kiyoshi. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

A theoretical model of self-magnetically insulated, coaxial type ion beam diode, 'Plasma Focus Diode' (PFD), is developed and analyzed in detail. In this theory, self-consistent electron current and space-charge limited ion current are incorporated. The steady-state charge and current distribution inside the diode is calculated for given diode voltage. We compare the calculated diode impedance with the experimental results obtained at the peak power, and good agreement was obtained. Some diode behaviours observed in the experiments are explained by the theory. From the theoretical understanding about PFD, we obtain the scaling relations of diode impedance and the ion-current efficiency, and use them to discuss the possible ways to improve the diode operation. (author).

**35465** (NIFS-PROC–5, pp. 79-88) **Generation and focusing of carbon ion beam by the 'Inverse Pinch Ion Diode'.** Hashimoto, Y. (Himeji Inst. of Tech., Hyogo (Japan)); Sato, M.; Yatsuzuka, M.; Nobuhara, S. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

Focusing of intense ion beams has been attained with the 'Inverse Pinch Ion Diode' which has a flat anode. The energy of the ion beam was 180 keV. At the focal point, the ion current density of 0.5 kA/cm$^2$ has been obtained and the focusing radius of the ion beam (FWHM) is 10 mm. Focusing of the ion beam is due to the electrostatic field in the 'Inverse Pinch Ion Diode'. (author).

**35466** (NIFS-PROC–5, pp. 89-97) **Generation of pulsed ion beams by an inductive storage pulsed power generator.** Katsuki, Sunao (Kumamoto Univ. (Japan)); Akiyama, Hidenori; Maeda, Sadao. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

A pulsed power generator by an inductive energy storage system is extremely compact and light in comparison with a conventional pulsed power generator, which consists of a Marx bank and a water pulse forming line. A compact and light pulsed power generator is applied to the generation of pulsed ion beams. A thin copper fuse is used as an opening switch, which is necessary in the inductive storage pulsed power generator. A magnetically insulated diode is used for the generation of ion beams. The pulsed ion beams are successfully generated by the inductive storage pulsed power generator for the first time. (author).

**35467** (NIFS-PROC–5, pp. 99-107) **Power plant by LIB fusion.** Niu, Keishiro (Tokyo Inst. of Tech. (Japan)); Aoki, Takayuki; Naramoto, Hiroya. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

A fusion power plant of 1GW electric output is proposed here by using proton beam of 12MJ for energy driver. The flibe for the coolant in the reactor cavity with a thickness of 50cm thermalizes the neutrons which produced by fusion reactions and protects the solid wall from being damaged. Tritium-breeding-radio can exceed unity. An indirect-driven-target will implode in a spherically symmetric way even in the nonuniform beam irradiation. (author).

**35468** (NIFS-PROC–5, pp. 109-119) **Control of gap closure in applied-B diode.** Aoki, Takayuki (Tokyo Inst. of Tech. (Japan)); Niu, Keishiro. National Inst. for Fusion Science, Nagoya (Japan). Oct 1990. (CONF-9002185--: Symposium on development of intense pulsed particle beams and its applications, Nagoya (Japan), 20 Feb 1990). In *Symposium on development of intense pulsed particle beams and its applications.* 128p. Order Number DE91780383. Source: OSTI; NTIS (US Sales Only); INIS.

The rapid gap closure due to the build-up of the electron sheath is analyzed by a new one dimensional particle-in-cell code. It is found that the diamagnetic effect of the electrons enhances the ion emission from the anode and increases the amount of the ion charge in the diode gap. The ion charge cancels out the electron charge in the sheath, so that the electron density of the sheath increases and the diamagnetism has more effect on the build-up of the sheath toward the anode. Two methods are proposed to control the gap closure. One is to increase the applied magnetic field and another is to limit the flux emitted at the anode surface. In the simulation results, it is shown that these methods improve the impedance characteristic of the diode. (author).

**35469** (ORNL/TM–11739) **Evaluation of weldments in Type 21-6-9 stainless steel for Compact Ignition Tokamak structural applications: Phase 1.** Alexander, D.J.; Goodwin, G.M.; Bloom, E.E. Oak Ridge National Lab., TN (United States). Jun 1991. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000379. Source: OSTI; NTIS; INIS; GPO Dep.

Primary design considerations for the Compact Ignition Tokamak toroidal field-coil cases are yield strength and toughness in the temperature range from 77 to 300 K. Type 21-6-9 stainless steel, also still known by its original Armco Steel Company trade name Nitronic 40, is the proposed alloy for this application. It has high yield strength and usually adequate base metal toughness, but weldments in thick sections have not been adequately characterized in terms of mechanical properties or hot-cracking propensity. In this study, weldability of the alloy in heavy sections and the mechanical properties of the resultant welds were investigated including tensile yield strength and Charpy V-notch toughness at 77 K and room temperature. Weldments were made in four different

base metals using seven different filler metals. None of the weldments showed any indication of hot-cracking problems. All base metals, including weldment heat-affected zones, were found to have adequate strength and impact toughness at both test temperatures. Weld metals, on the other hand, except ERNiCr-3 and ENiCrFe-3 had impact toughnesses of less than 67 J at 77 K. Inconel 82 had an average weld metal impact toughness of over 135 J at 77 K, and although its strength at 77 K is less than that of type 21-6-9 base metal, at this point it is considered to be the first-choice filler metal. Phase 2 of this program will concentrate on composition refinement and process/procedure optimization for the generic ERNiCr-3 composition and will generate a design data base for base and weld metal, including tensile, fracture toughness, and crack growth rate data.

**35470** (ORNL/TM–11781) **Tritium proof-of-principle pellet injector.** Fisher, P.W. Oak Ridge National Lab., TN (United States). Jul 1991. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000390. Source: OSTI; NTIS; INIS; GPO Dep.

The tritium proof-of-principle (TPOP) experiment was designed and built by Oak Ridge National Laboratory (ORNL) to demonstrate the formation and acceleration of the world's first tritium pellets for fueling of future fusion reactors. The experiment was first used to produce hydrogen and deuterium pellets at ORNL. It was then moved to the Tritium Systems Test Assembly at Los Alamos National Laboratory for the production of tritium pellets. The injector used in situ condensation to produce cylindrical pellets in a 1-m-long, 4-mm-ID barrel. A cryogenic $^3$He separator, which was an integral part of the gun assembly, was capable of lowering $^3$He levels in the feed gas to <0.005%. The experiment was housed to a glovebox for tritium containment. Nearly 1500 pellets were produced during the course of the experiment, and about a third of these were pure tritium or mixtures of deuterium and tritium. Over 100 kCi of tritium was processed through the experiment without incident. Tritium pellet velocities of 1400 m/s were achieved with high-pressure hydrogen propellant. The design, operation, and results of this experiment are summarized. 34 refs., 44 figs., 3 tabs.

**35471** (UCLA/PPG–1200-Vol.1) **The TITAN reversed-field-pinch fusion reactor study: Volume 1: Executive summary: Final report.** California Univ., Los Angeles, CA (United States); General Atomics, San Diego, CA (United States); Los Alamos National Lab., NM (United States); Rensselaer Polytechnic Inst., Troy, NY (United States). Source: OSTI; NTIS; INIS: GPO Dep.

This report discusses the following topics: overview of titan-2 design; titan-2 fusion-power-core engineering; titan-2 divertor engineering; titan-2 tritium systems; titan-2 safety design and radioactive-waste disposal; and titan-2 maintenance procedures.

**35474** (UCRL-ID–106094) **An analysis of grazing incidence metal mirrors in a laser ICF reactor driver.** Bieri, R.; Guinan, M. Lawrence Livermore National Lab., CA (United States). 12 Jul 1991. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000093. Source: OSTI; NTIS; INIS; GPO Dep.

Grazing incidence metal mirrors (GIMMs) are examined to replace dielectric mirrors for the final elements in a laser beam line for an inertial confinement fusion reactor. For a laser driver with a wavelength from 250 to 500 nm in a 10-ns pulse, irradiated mirrors made of Al, Al alloys, or Mg were found to have calculated laser damage limits of 0.3–2.3 J/cm$^2$ of beam energy and neutron lifetime fluence limits of over $5 \times 10^{20}$ 14 MeV n/cm$^2$ when used at grazing incidence and operated at room temperature or at 77 K. A final focusing system including mirrors made of Al alloy 7475 at room temperature or at liquid nitrogen temperatures used with a driver which delivers 5 MJ of beam energy in 32 beams would require 32 mirrors of roughly 10 m$^2$ each. This chapter includes calculations of damage limits for GIMMs and discusses critical issues relevant to the integrity and lifetime of such mirrors in a reactor environment. The reflectivities of various metals are calculated from measured optical constants at room temperature and at cryogenic temperatures for 250- to 500-nm light at both normal and grazing incidence. Then, for the mirrors in a representative system, the thermal absorption and conduction rates of the best candidate metals are used with the maximum allowable cyclic thermal stress to give the maximum allowed surface-temperature rise and surface thermal load. The allowed surface thermal load and surface reflectivity give the maximum beam energy density and the minimum size for each mirror. For mirrors made of aluminum alloy 7475 and initially operated at room temperature, the resulting optical damage threshold and allowable temperature rise give a required mirror size for each final mirror. Critical issues relevant to the integrity and lifetime of such mirrors in a reactor environment are briefly discussed.

## 99 GENERAL AND MISCELLANEOUS

**35475** (DOE/ER–0497) **Guide for the preparation of proposals for the Pre-Freshman Enrichment Program (PREP), 1992: Notice of Program Solicitation No. 71.** USDOE Office of Energy Research, Washington, DC (United States). Office of University and Science Education Programs; Associated Western Universities, Inc., Salt Lake City, UT (United States). Aug 1991. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract PS05-92ER79030. Order Number DE91018499. Source: OSTI; NTIS; GPO Dep.

The Pre-Freshman Enrichment Program (PREP) is aimed at increasing the number of underrepresented minority and women students entering all science and mathematics-based professions. This focus reflects the need to broaden the US science and engineering base. The Department of Energy (DOE) is concerned about the availability of science and engineering professionals to perform its mission and is authorized to assure an adequate supply of manpower for the accomplishment of energy research and development programs by sponsoring and assisting education and training activities. The primary purpose of PREP is to help alleviate manpower shortages in science-based careers by preparing students for, and motivating them to take, college-preparatory courses in science and mathematics. The Pre-Freshman Enrichment Program (PREP) will provide funds to colleges and universities for projects aimed at seeking out populations, typically underrepresented in science-based careers, during junior high school and early high school years (sixth through tenth grades) and providing them with pre-freshman enrichment experiences. These experiences shall consist of activities to identify, motivate and prepare

students for science-based careers. Applicants must describe intended outcome for each PREP project and show how these outcomes are to be measured. Established programs should describe previous program outcomes. It is highly desirable that the PREP activities of the proposing institution be correlated with and built upon the broader activities of the national efforts for improving science and mathematics education in the US. This guide for application to PREP includes copies of the required forms.

**35476** (ORNL/tr–91/7) **Lift-off tape and its use.** Korpman, R. (Johnson Johnson, (New Brunswick, NY)). Oak Ridge National Lab., TN (United States). [1991]. 23p. Translation of German Patent No. 28,33,243, February 15, 1979. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE91017793. Source: OSTI; NTIS; GPO Dep.

This report describes the invention of an adhesive tape. The tape could be used for typewriter correction ribbon applications. (JL).

**35477** (ORNL/tr–91-9) **Transfer materials.** Blair, S.D.; Elbert, D.L.; Waldrip, G.A. Oak Ridge National Lab., TN (United States). 1991. 21p. Translation of German Patent Application No. 2,335,838, February 21, 1974. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE91017792. Source: OSTI; NTIS; GPO Dep.

This report describes the invention of typewriter correction ribbons. A tape formulation and production method is detailed. (JL)

**35478** (ORNL/tr–91-13) **Heat-transfer material.** Katayama, Masahito (Canon Inc., Tokyo (Japan)); Sato, Hiroshi; Takizawa, Yoshihisa; Asaoka, Masanobu; Fukuda, Tsugihiro. Oak Ridge National Lab., TN (United States). [1991]. 28p. Translation of Japanese Kokai Patent No. Sho 63[1988]-309493, December 16, 1988. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE91017723. Source: OSTI; NTIS; GPO Dep.

The present invention concerns heat-transfer material used for heat transfer recording, especially heat-transfer material providing good recorded images on a substrate of poor surface smoothness, and the images can be corrected by a liftoff correction tape that produces adhesive properties when heated.

*Refer also to citation(s) 33721, 33748, 33795, 33865, 34065, 34071, 34072, 34073, 34095, 34110, 34161, 34213, 34242, 34782, 34971, 35018, 35029, 35504, 35547, 35564*

**35479** (DOE/EH–0208P) **Organizational Cultural Assessment of the Solar Energy Research Institute.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Jun 1991. 80p. Sponsored by USDOE, Washington, DC (United States). Order Number DE91018649. Source: OSTI; NTIS; GPO Dep.

An Organizational Cultural Assessment (OCA) was performed at the Solar Energy Research Institute (SERI) by administering an Organizational Culture Survey (OCS) that queried employees on the subjects of organizational culture, various aspects of communications, employee commitment, work group cohesion, coordination of work, environmental concerns, hazardous nature of work, safety and overall job satisfaction. The purpose of the OCS is to measure in a quantitative and objective way the notion of "culture;" that is, the values, attitudes, and beliefs of the individuals working within the organization. In addition, through the OCS, a broad simple of individuals can be reached that would probably not be interviewed or observed during the course of a typical assessment. The OCS also provides a descriptive profile of the organization at one point in time that can then be compared to a profile taken at a different point in time to assess changes in the culture of the organization. All data from the OCS is presented in group summaries, by division, supervisory level, and staff classification. Statistically significant differences between groups are identified and discussed. The most notable finding which emerges from the OCA conducted at SERI is that it is a very homogeneous organization as indicated by the few statistically significant differences found between divisions/offices, staff classifications, and supervisory levels. The results also indicate SERI to be an organization which places a large amount of emphasis on those behaviors which are considered "constructive" (i.e., Humanistic-Encouraging, Affiliative, Achievement, Self-Actualizing) and, although to a lesser extent, on those behaviors which could be regarded as "passive/defensive" (i.e., Approval, Conventional, Dependent, Avoidance). 9 refs., 11 figs., 6 tabs.

**35480** (DOE/OR/00033–T452) **University programs and facilities in nuclear science and engineering: Seventh edition.** Oak Ridge Associated Universities, Inc., TN (United States). Jan 1991. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE91018192. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy is pleased to publish the seventh edition of University Programs and Facilities in Nuclear Science and Engineering. This publication presents the results of the recent "Survey of University Programs and Facilities in Nuclear Science and Engineering," a voluntary survey conducted by Oak Ridge Associated Universities for DOE. The collection of data for this publication helps DOE meet its mandated obligation to "assure an adequate supply of manpower for ··· energy research and development programs by ··· dissemination of necessary manpower supply and demand data." Furthermore, the data assists the Office of Energy Research in its "responsibility to advise the Secretary with respect to education and training activities required for effective ··· research activities of the Department." This publication presents detailed information for 110 universities and colleges with nuclear and nuclear-related programs/facilities relevant to DOE's mission. In addition to providing needed information for DOE, the publication should be useful to government agencies, university faculty and administrators, students, as well as to DOE contractors and private sector companies.

**35481** (EUR-ICP-CEH–076(S)) **Working group on public health preparedness for nuclear accidents in the near field, Badhoevedorp, Netherlands, 11-14 October 1988: Summary report.** World Health Organization, Copenhagen (Denmark). Regional Office for Europe. 1989. 5p. (CONF-8810551–: Working group on public health preparedness for nuclear accidents in the near field, Badhoevedorp (Netherlands), 11-14 Oct 1988). Source: OSTI; NTIS (US Sales Only); INIS.

Also issued in French, German and Russian.

This report summarizes the conclusions and recommendations of a working group on the planning of measures to safeguard public health in the event of a nuclear accident. Treatment of irradiated and contaminated people was discussed, and countermeasures such as evacuation or sheltering and iodine prophylaxis were considered. The importance of public information was stressed, and it was recommended that public health authorities develop programmes to select ways of educating and preparing communities located close to the site of a potential nuclear accident.

**35482** (HMI-B–485) **HMI annual report 1990.** Hahn-Meitner-Institut Berlin GmbH (Germany). 1991. 152p. (In German). Order Number DE92714363. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the activities of the Hahn-Meitner-Institut (HMI) on four special subjects: 1. Nuclear physics (nuclear reactions, nuclear structure, VICKSI accelerator development), 2. photochemical energy conversion (basic and material research, radiation chemistry), 3. structure research (theory of many-body systems, solid-state physics, neutron scattering, highly stressed metallic materials, trace nutrients in health and nutrition), and 4. information technics (software, real time systems, semiconductor subassembly). The following is presented for every special subject: a) the topics worked on in 1989, b) selected results and c) publications, lectures, theses submitted for diplomas and doctoral theses. (orig.).

**35483** (JAERI-M–91-038) **A translation of NUREG-1355, 'The status of recommendations of the President's Commission on the accident at Three Mile Island - a ten year review'.** Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1991. 114p. Translation of NUREG-1355. (In Japanese). Order Number DE92713850. Source: OSTI; NTIS (US Sales Only); INIS.

Twelve years passed since the TMI accident in March 1979. Actions taken as a consequence of this accident in the United States (U.S.) for better assurance of nuclear power plant resulted in

significant changes in nuclear regulation and plant safety management. These actions also resulted in reorientation in nuclear safety research including initiation of new research projects. These actions were taken in response to recommendations made by the President's Commission (named Kemmeny Commission) which was appointed by the President two weeks after the accident initiation. In 1989, the U.S. Nuclear Regulatory Commission (USNRC) issued a report (NUREG-1355) which summarizes its actions taken in response to the recommendations of President's Commission during the ten years after the accident. This report is a translation of this USNRC report. The translation was made by the collaboration of several engineers at JAERI. It is hoped that this translation would help those who are interested in the past and ongoing actions in U.S. (author).

**35484** (KEK-PR-90-3) **Photon Factory activity report, 1990.** National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). 1991. 504p. Order Number DE92704339. Source: OSTI; NTIS (US Sales Only); INIS.

The Photon Factory has grown at a considerable rate, and 600 experiments are carried out in 1991, while the number of users is now 2300 including about 500 from industrial sectors. The use of synchrotron radiation increased from fundamental research to industrial development. The development at the Photon Factory is supported by the capability of the accelerators. At present, the 2.5 GeV PF ring is operated with positrons at the initial beam current of 350 mA. The total operation time was 3500 hours in the fiscal year 1990. The development of an avalanche mode photodiode, the observation of quantum beat in the experiment of nuclear Bragg scattering, the measurement of photo-electron and photo-ion spectroscopy were carried out. The conversion of TRISTAN main ring to an ultrahigh brilliance and high coherence source is planned for the future. The annual PF Symposium was held, and Professor H. Winick gave the lecture 'Ultrahigh brightness and coherent radiation from large storage rings'. In this report, the outline of the Photon Factory and the activities in Divisions of Injector Linac, Light Source and Instrumentation are described. (K.I.).

**35485** (KFK-4925) **List of the scientific publications of the Karlsruhe Nuclear Research Center in 1990.** Kernforschungszentrum Karlsruhe GmbH (Germany). May 1991. 148p. (In German). Order Number DE92714347. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains the titles of all publications from 1990. In the case of patents, all rights established or published during 1990 are indicated: patents, information sheets (DE-OS). The list of publications is ordered according to institutes. Under projects, only published project reports and publications by staff working on the particular projects are listed. Also included are publications printed in the Kernforschungszentrum from research and development plans within the Production Technology Project (PFT) and the project called 'European Research Center for the Control of Air Pollution' (PEF), which were carried out by the Kernforschungszentrum as project sponsor in cooperation with firms and institutes. The list also includes publications of the branch of the Federal Research Institute for Nutrition based at the Kernforschungszentrum. (orig./HP).

**35486** (KUTL-3) **Kyushu University Tandem Accelerator Laboratory report, 1988-1990.** Sagara, Kenshi; Morinobu, Shunpei (eds.). Kyushu Univ., Fukuoka (Japan). Faculty of Science. Mar 1991. 263p. Order Number DE92704337. Source: OSTI; NTIS (US Sales Only); INIS.

Ten years have elapsed since the first beam was obtained from the Kyushu University tandem accelerator. Although the laboratory has achieved successful scientific results, the performance of the accelerator has been on a decline mainly due to the aging. In the last two and a half years, the tandem accelerator has suffered from the fall of terminal voltage to around 8 MV. However, the experimental studies in the laboratory have been active. The utilization of the polarized beams of protons and deuterons to study the scattering of the p+d system, the use of heavy ion beam for the systematic search for the molecular resonance in relatively heavy systems and for the study on reaction mechanism, the use of both light and heavy ion beams for the studies on nuclear engineering, material science and geological science and so on were carried out. The gamma ray spectroscopic study on the state near yrast line was largely hampered by the accelerator troubles, instead, the collaboration with the Niels Bohr Institute provided a wonderful research ground for the studies. (K.I.).

**35487** (LA-12175-MS) **The prioritization of environment, safety, and health activities.** Otway, H.; Puckett, J.M.; von Winterfeldt, D. Los Alamos National Lab., NM (United States). Sep 1991. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92000089. Source: OSTI; NTIS; GPO Dep.

Federal facilities, including the national laboratories, must bring existing operations into compliance with environment, safety, and health (ES&H) regulations while restoring sites of past operations to conform with today's more rigorous standards. The need for ES&H resources is increasing while overall budgets are decreasing, and the resulting staffing and financial constraints often make it impossible to carry out all necessary activities simultaneously. This stimulated interest in formal methods to prioritize ES&H activities. We describe the development of an approach called MAPP (Multi-Attribute Prioritization Process), which features expert judgment, user values, and intensive user participation in the system design process. We present results of its application to the prioritization of 41 ES&H activities having a total cost of over $25 million. We conclude that the insights gained from user participation in the design process and the formal prioritization results are probably of comparable value. 19 refs., 3 figs., 9 tabs.

**35488** (NIRS-29) **Annual report of National Institute of Radiological Sciences, April 1989 - March 1990.** National Inst. of Radiological Sciences, Chiba (Japan). Jul 1990. 136p. Order Number DE92704341. Source: OSTI; NTIS (US Sales Only); INIS.

This annual report is a compilation of the research activities and achievement in the National Institute of Radiological Sciences (NIRS) in Japan during the fiscal year 1990 (from April 1989 through March 1990). Efforts at the NIRS are particularly aimed at three long term projects: 'risk due to low level radiation exposure to the general population', 'assessment of radiation exposure of the public to radioactivities as related to the environment', and 'food chain and medical use of accelerated heavy ions'. The research covers a wide range of radiological sciences from molecular to environmental studies and medicine including engineering. Topics consists of physics, chemistry, bio-medical science, clinical research, and environmental sciences, covering a total of 80 titles. A list of publications by staff members, activities of research divisions, and organization chart of the NIRS are given in Appendix. (N.K.).

**35489** (NIRS-AR-33) **Annual report of National Institute of Radiological Sciences of the fiscal year 1989.** National Inst. of Radiological Sciences, Chiba (Japan). Dec 1990. 267p. (In Japanese). Order Number DE92704009. Source: OSTI; NTIS (US Sales Only); INIS.

This annual report presents the activities of the National Institute of Radiological Sciences in Japan in the fiscal year 1989. The activities are divided into research, technical aids, training, medical services, management, library or editing, and international cooperation. Research activities are described under the following sections: (I) newly started special researches for 'biological risk evaluation in public exposure' and 'exposure assessment in the environment and the public involved in food chain', and the continuing special research for 'medical use of accelerated heavy ions'; (II) six assigned researches; (III) ordinary researches concerning physics, pharmachochemistry, biology, genetics, pathology and physiology, cell biology, internal exposure, environmental science, clinical research, clinical research for radiation injuries, medical use of heavy particles, environmental radiation ecology, and aquatic radiation ecology; (IV) risk estimation of radiation; (V) actual surveys for Bikini victims, population doses of medical and occupational exposure, and thorotrast exposure; (VI) project research; (VII) radioactivity survey; (VIII) research supported by Science and Technology Agency aids. Appendices include the personnel list and the bibliography of articles reported by the staff. (N.K.) 809 refs.

**35490** (ORNL-6681) **Handbook for state energy emergency planning.** Oak Ridge National Lab., TN (United States); USDOE

Assistant Secretary for International Affairs and Energy Emergencies, Washington, DC (United States). Office of the Deputy Assistant Secretary for Energy Emergencies. Sep 1991. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000403. Source: OSTI; NTIS; GPO Dep.

This document presents some basic ideas about developing plans for dealing with energy shortages and contains a range of topics and considerations that state government officials and planners may wish to review in formulating an energy emergency plan. Those states in advanced stages of plan development might wish to use this document as a means of reviewing their plans or for possible revisions or refinements. This document introduces a number of key factors and options from which states may choose when finalizing their energy emergency plans. The report is intended to serve as a vehicle for improving planning efforts and does not seek to provide criteria by which to judge or compare different states' plans. There are six basic steps to the planning format presented in this report. The remainder of this document builds upon the outline, providing additional detail on such topics as preliminary planning,legal issues, organizational structures, selection of mitigation measures, and historical reviews. Appendix A lists information sources, and Appendix B contains responses to the State Emergency Plan Survey, updated in October 1990.

**35491** (SAND–91-1340C) **The Silver Bullet Skunk Works: Holistic design of the answering system 1300.** Andrews, A.K. Sandia National Labs., Albuquerque, NM (United States). [1991]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-911237–1: 7. Department of Energy workshop on CAE, Knoxville, TN (United States), 29 Dec 1991). Order Number DE91015336. Source: OSTI; NTIS; GPO Dep.

The Silver Bullet Skunk Works, and experimental product realization team at AT&T Consumer Products, designed and shipped a new telephone answering system to market in eight months, approximately one year faster than previous AT&T products of similar complexity. This paper outlines the Design for "X" (DFX) philosophies and the team structure that enabled the group to accelerate the Product Realization Process. The Answering System 1300, developed in record time, was a successful product that met its schedule and cost objectives, and sold out its entire high-volume manufacturing run. Lessons learned from the Skunk Works experience have since been applied to other development activities in AT&T Consumer Products. 3 figs.

**35492** (SAND–91-2090C) **Effective waste minimization in an R&D setting: The program at Sandia National Laboratories.** Reilly, H.E. Sandia National Labs., Albuquerque, NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9109259–2: 1. international congress on environmentally conscious manufacturing, Santa Fe, NM (United States), 18 Sep 1991). Order Number DE91019051. Source: OSTI; NTIS; GPO Dep.

An important aspect of environmentally-conscious operations is adoption of an aggressive waste minimization program. This paper describes the waste minimization and pollution prevention program at Sandia National Laboratories. Although Sandia's approach is patterned after the generic waste minimization models proposed by the Environmental Protection Agency and the Department of Energy, the specifics of implementation, and the potential for payoff, are influenced by the R&D nature of Sandia's work. Key aspects of the program are discussed, including why Sandia is developing and conducting the program; objectives; elements of the program; our approach to implementation; the magnitude of the undertaking; and the expected payoff. 3 refs., 2 figs.

**35493** (SNV–3890) **Risk assessment - a research program aimed at health risks from air pollution in the general environment.** Lindahl-Kiessling, K. (Uppsala Univ. (Sweden). Zoofysiologiska institutionen); Ahlborg, U.; Bylin, G.; Ehrenberg, L.; Hemminki, K.; Lindell, B.; Nilsson, Robert. National Swedish Environment Protection Board, Solna (Sweden). Jan 1991. 52p. (In Swedish). Order Number DE92601581. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents a new research program for assessment of health risks caused by air pollutants. It is important to develop general methods for quantitative risk assessments and to improve the scientific base materials. (KAE).

**35494** (UCRL-ID–108268) **Sourcing Program: To identify outstanding women and ethnic minorities in research and research management.** Nissen, S.H. Lawrence Livermore National Lab., CA (United States). Aug 1991. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000097. Source: OSTI; NTIS; GPO Dep.

To meet the challenges of the changing demographics and a projected shortage of technically trained workers in the 21st century, Lawrence Livermore National (LLNL) is increasing its commitment to develop a diverse work force with the abilities to carry out the Laboratory's missions. In addition to the recruitment programs already established at LLNL, a sourcing program to identify outstanding women and minorities in research and research management was initiated in the summer of 1990. A research methodology, time table, selection criteria, and data generation strategy were designed and implemented for this program. Through extensive contacts with R&D facilities, women's and minority professional organizations, national research councils, technical professional societies and universities, other sourcing programs were investigated and evaluated and a network of contacts and resources was developed. This report describes the design and implementation of the sourcing program targeting outstanding women and minorities in science and engineering. It details the investigation and evaluation of sourcing programs in other R&D facilities and provides information regarding methods and sources used to identify potential candidates. Conclusions and recommendations are presented. 10 refs., 5 tabs.

**35495** (ANL–91/15) **Studying parallel program behavior with upshot.** Herrarte, V.; Lusk, E. Argonne National Lab., IL (United States). Aug 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE91019072. Source: OSTI; NTIS; GPO Dep.

This is a description of and a user's manual for upshot, an X-based graphics tool for viewing log files produced by parallel programs. 5 refs., 3 figs.

**35496** (ANL–91/32) **Parallel programming with PCN.** Foster, I.; Tuecke, S. Argonne National Lab., IL (United States). Sep 1991. 66p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract CCR-8809615;AFOSR-91-0070;ONR-N00014-89-J-3201;N00014-8 Order Number DE91019005. Source: OSTI; NTIS; GPO Dep.

PCN is a system for developing and executing parallel programs. It comprises a high-level programming language, a set of tools for developing and debugging programs in this language, and interfaces to Fortran and C that allow the reuse of existing code in multilingual parallel programs. Programs developed using PCN are portable across many different workstations, networks, and parallel computers. This document provides all the information required to develop parallel programs with the PCN programming system. It includes both tutorial and reference material. It also presents the basic concepts that underlie PCN, particularly where these are likely to be unfamiliar to the reader, and provides pointers to other documentation on the PCN language, programming techniques, and tools. PCN is in the public domain. The latest version of both

the software and this manual can be obtained by anonymous FTP from Argonne National Laboratory at info.mcs.anl.gov.

35497 (CIEMAT–670) **"AJUSTAR" an interactive processor for to Fit, by means of least squares, one variable polynomials (arbitrary degree) at experimental points.** Sanchez, J.J.; Pena, J. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1991. 55p. (In Spanish). Order Number DE92700010. Source: OSTI; NTIS (US Sales Only).

In this report is offered, to scientists and technical people, a numeric tool consisting in a FORTRAN program, of interactive use, with destination to make lineal "least squares" fit on any set of empirical observations. The method based in the orthogonal functions (for discrete case), instead of direct solving the equations system, is used. The procedure includes also the optionally facilities of: variable change, direct interpolation, correlation non linear factor, "weights" of the points, confidence intervals (Scheffe, Miller, Student), and plotting results. (Author)

35498 (CONF-8906112–, pp. 85-92) **Torus structure in higher dimensional Hamiltonian systems.** Gyoergyi, G. (Stevens Inst. of Tech., Hoboken, NJ (USA)); Ling, F.H.; Schmidt, G. Argonne National Lab., IL (United States). [1989]. DOE Contract FG02-87ER13740. From 7. symposium on energy engineering sciences; Argonne, IL (United States); 19-21 Jun 1989. In *Proceedings of the seventh symposium on energy engineering sciences: Nonlinear mechanics and mechanical systems.* 239p. Order Number DE90000872. Source: OSTI; NTIS.

Island tori of coupled standard maps are investigated. The study of invariants of the tangent map shows that the tori are embedded in higher dimensional topological spheres. A new numerical method, the quasi surface of sections construction, reveals the torus structure in the nonlinear domain. Scaling laws and estimates for island boundaries are obtained. Arnold diffusion out of the island is found to be nonexistent or exceedingly slow. The measure of phase space occupied by islands, versus that occupied by chaotic trajectories is shown to decline rapidly as the number of degrees of freedom increases.

35499 (CONF-9104300–1) **Using computer experiments to construct a cheap substitute for an expensive simulation model.** Mitchell, T.; Morris, M. Oak Ridge National Lab., TN (United States). [1991]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Interface 1991: computing science and statistics; Seattle, WA (United States); 22-24 Apr 1991. Order Number DE92000421. Source: OSTI; NTIS; GPO Dep.

There is widespread use of computer models as tools in scientific research. As surrogates for physical or behavioral systems, such models can be subjected to experimentation, the goal being to predict how the corresponding real system would behave under certain conditions. For long-running (expensive) model codes, there may be a severe limitation on the number of experiments that can reasonably be done. This motivates the construction of a fast-running (cheap) approximation to the original code, for use in experiments where a large number of runs may be necessary. Here we discuss our approximation of a simulation model for the compression molding of sheet molding compound, applied to the manufacture of an automobile hood. The approximation was constructed using Bayesian interpolation methods for prediction of the movement of the flow front. The predictions were based on data generated by a sequence of computer experiments, using designs chosen according to a type of D-optimality criterion. 8 refs., 1 tab.

35500 (CONF-9105202–) **Proceedings of the first energy research power supercomputer users symposium.** USDOE Office of Energy Research, Washington, DC (United States). Scientific Computing Staff. [1991]. 173p. Sponsored by USDOE, Washington, DC (United States). From 1. energy research power supercomputer users symposium; Gaithersburg, MD (United States); 21-22 May 1991. Order Number DE91018877. Source: OSTI; NTIS; INIS; GPO Dep.

The Energy Research Power Supercomputer Users Symposium was arranged to showcase the richness of science that has been pursued and accomplished in this program through the use of supercomputers and now high performance parallel computers over the last year: this report is the collection of the presentations given at the Symposium. "Power users" were invited by the ER Supercomputer Access Committee to show that the use of these computational tools and the associated data communications network, ESNet, go beyond merely speeding up computations. Today the work often directly contributes to the advancement of the conceptual developments in their fields and the computational and network resources form the very infrastructure of today's science. The Symposium also provided an opportunity, which is rare in this day of network access to computing resources, for the invited users to compare and discuss their techniques and approaches with those used in other ER disciplines. The significance of new parallel architectures was highlighted by the interesting evening talk given by Dr. Stephen Orszag of Princeton University.

35501 (CONF-9109121–4) **The changing face of probability.** Tonn, B.E. (Oak Ridge National Lab., TN (United States)); Valverde A, L.J. Jr. Oak Ridge National Lab., TN (United States). Sep 1991. 13p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From Symposium on expert system applications for the electric power industry; Boston, MA (United States); 9-11 Sep 1991. Order Number DE91018857. Source: OSTI; NTIS; GPO Dep.

During the course of the past several centuries, the concept of probability has evolved in both interesting and varied ways. In this paper we consider various facets of the conceptual evolution of probability. We begin with a brief historical overview of the earliest conceptions of probability. We then consider the rise of probability in the twentieth century, and some of the central views that have emerged. The paper concludes with a discussion of some of the current trends in modern probability theory. 6 refs., 1 fig.

35502 (DOE/ER/25001–T6) **Cedar Project—Original goals and progress to date: Progress report, January 25, 1991–January 24, 1991.** Cybenko, G.; Kuck, D.; Padua, D.; Gallopoulos, E. Illinois Univ., Urbana, IL (United States). Center for Supercomputing Research and Development. 5 Sep 1991. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER25001. Order Number DE92000032. Source: OSTI; NTIS; GPO Dep.

This report describes: Cedar System Hardware; Compiler and Software Issues on Memory Management; Operating Systems; Compilers; and Multiprocessor Performance on Algorithms and Applications.

35503 (DOE/ER/25041–4) **Computer aided surface representation: [Final report].** Barnhill, R.E. Arizona State Univ., Tempe, AZ (United States). Dept. of Chemical Engineering. 2 Apr 1991. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER25041. Order Number DE91018872. Source: OSTI; NTIS; GPO Dep.

Modern computing resources permit the generation of large amounts of numerical data. These large data sets, if left in numerical form, can be overwhelming. Such large data sets are usually discrete points from some underlying physical phenomenon. Because we need to evaluate the phenomenon at places where we don't have data, a continuous representation (a "surface") is required. A simple example is a weather map obtained from a discrete set of weather stations. (For more examples including multi-dimensional ones, see the article by Dr. Rosemary Chang in the enclosed IRIS Universe). In order to create a scientific structure encompassing the data, we construct an interpolating mathematical surface which can evaluate at arbitrary locations. We can also display and analyze the results via interactive computer graphics. In our research we construct a very wide variety of surfaces for applied geometry problems that have sound theoretical foundations. However, our surfaces have the distinguishing feature that they are constructed to solve short or long term practical problems. This DOE-funded project has developed the premiere research team in the subject of constructing surfaces (3D and higher dimensional) that provide smooth representations of real scientific and engineering information, including state of the art computer graphics visualizations. However, our main contribution is in the development of fundamental constructive mathematical methods and visualization techniques which can be incorporated into a wide

variety of applications. This project combines constructive mathematics, algorithms, and computer graphics, all applied to real problems. The project is a unique resource, considered by our peers to be a de facto national center for this type of research.

**35504** (EGG-EE–9479) **An independent review of the Multi-Path Redundant Avionics Suite (MPRAS) architecture assessment and characterization report.** Johnson, M.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1991. 23p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE91018692. Source: OSTI; NTIS; GPO Dep.

In recent years the NASA Langley Research Center has funded several contractors to conduct conceptual designs defining architectures for fault tolerant computer systems. Such a system is referred to as a Multi-Path Redundant Avionics Suite (MPRAS), and would form the basis for avionics systems that would be used in future families of space vehicles in a variety of missions. The principal contractors were General Dynamics, Boeing, and Draper Laboratories. These contractors participated in a series of review meetings, and submitted final reports defining their candidate architectures. NASA then commissioned the Research Triangle Institute (RTI) to perform an assessment of these architectures to identify strengths and weaknesses of each. This report is a separate, independent review of the RTI assessment, done primarily to assure that the assessment was comprehensive and objective. The report also includes general recommendations relative to further MPRAS development.

**35505** (IS–5055) **Signal processing algorithms on parallel architectures: A performance update.** Rover, D.; Tsai, V.; Chow, Yin-Shan; Gustafson, J. Ames Lab., IA (United States). Feb 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE92000525. Source: OSTI; NTIS; GPO Dep.

The Burg algorithm is a widely applied and extensively studied signal processing procedure having a structure typical of a class of important batch signal processing algorithms. Its implementation and performance on four different parallel machines were reported in the 1990 Journal of Parallel and Distributed Computing Special Issue on Massively Parallel Computation. The machines were: the Intel iPSC/2, the Denelcor HEP, the NASA/Goodyear MPP, and the Cray X-MP/48. The objective of the work reported here was to extend that study to two new parallel machines: the nCUBE 2 and the MasPar MP-1. These computers are related to the distributed memory systems above (i.e., the iPSC and the MPP, respectively), but use newer technology. In addition to achieving significant performance gains on the new machines compared to machines in the same architectural class, we found that the original study underestimated the scaleability of the algorithm. That is, the algorithm maps efficiently to small-scale as well as large-scale computers, including both SIMD and MIMD distributed memory systems. Improvements in the parallel algorithm are highlighted. Of special import is the use of appropriate performance metrics and performance visualization to characterize the parallelism of the algorithm and lend insight toward understanding and evaluating its performance. 14 refs., 9 figs.

**35506** (KCP–613-4624) **Pulse code modulation data compression for automated test equipment.** Navickas, T.A.; Jones, S.G. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-911187–2: International telemetering conference, Las Vegas, NV (United States), 4 Nov 1991). Order Number DE92000464. Source: OSTI; NTIS; GPO Dep.

Development of automated test equipment for an advanced telemetry system requires continuous monitoring of PCM data while exercising telemetry inputs. This requirements leads to a large amount of data that needs to be stored and later analyzed. For example, a data stream of 4 Mbits/s and a test time of thirty minutes would yield 900 Mbytes of raw data. With this raw data, information needs to be stored to correlate the raw data to the test stimulus. This leads to a total of 1.8 Gb of data to be stored and analyzed. There is no method to analyze this amount of data in a reasonable time. A data compression method is needed to reduce the amount of data collected to a reasonable amount. The solution to the problem was data reduction. Data reduction was accomplished by real time limit checking, time stamping, and smart software. Limit checking was accomplished by an eight state finite state machine and four compression algorithms. Time stamping was needed to correlate stimulus to the appropriate output for data reconstruction. The software was written in the C programming language with a DOS extender used to allow it to run in extended mode. A 94–98% compression in the amount of data gathered was accomplished using this method. 1 fig.

**35507** (LA-UR–91-1068) **An assessment of the ModSim/TWOS parallel simulation environment.** Rich, D.O.; Michelsen, R.E. Los Alamos National Lab., NM (United States). [1991]. 17p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-911224–1: 1991 winter simulation conference, Phoenix, AZ (United States), Dec 1991). Order Number DE91011400. Source: OSTI; NTIS; GPO Dep.

The Time Warp Operating System (TWOS) has been the focus of significant research in parallel, discrete-event simulation (PDES). A new language, ModSim, has been developed for use in conjunction with TWOS. The coupling of ModSim and TWOS is an attempt to address the development of large-scale, complex, discrete-event simulation models for parallel execution. The approach, simply stated, is to provide a high-level simulation-language that embodies well-known software engineering principles combined with a high-performance parallel execution environment. The inherent difficulty with this approach is the mapping of the simulation application to the parallel run-time environment. To use TWOS, Time Warp applications are currently developed in C and must be tailored according to a set of constraints and conventions. C/TWOS applications are carefully developed using explicit calls to the Time Warp primitives; thus, the mapping of application to parallel run-time environment is done by the application developer. The disadvantage to this approach is the questionable scalability to larger software efforts; the obvious advantage is the degree of control over managing the efficient execution of the application. The ModSim/TWOS system provides an automatic mapping from a ModSim application to an equivalent C/TWOS application. The major flaw with the ModSim/TWOS system is it currently exists is that there is no compiler support for mapping a ModSim application into an efficient C/TWOS application. Moreover, the ModSim language as currently defined does not provide explicit hooks into the Time Warp Operating System and hence the developer is unable to tailor a ModSim application in the same fashion that a C application can be tailored. Without sufficient compiler support, there is a mismatch between ModSim's object-oriented, process-based execution model and the Time Warp execution model.

**35508** (LA-UR–91-2923) **NFS as a user interface to a high-performance data system.** Mercier, C.W. Los Alamos National Lab., NM (United States). [1991]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9110219–1: ONC/Network File System (NFS) industry networking conference, Santa Clara, CA (United States), 6-8 Oct 1991). Order Number DE92000254. Source: OSTI; NTIS; GPO Dep.

The Network File System (NFS) will be the user interface to a High-Performance Data System (HPDS) being developed at Los Alamos National Laboratory (LANL). HPDS will manage high-capacity, high-performance storage systems connected directly to a high-speed network from distributed workstations. NFS will be modified to maximize performance and to manage massive amounts of data. 6 refs., 3 figs.

**35509** (LA-UR–91-2924) **Los Alamos National Laboratory's high-performance data system.** Mercier, C.; Chorn, G.; Christman, R.; Collins, B. Los Alamos National Lab., NM (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9109276–2: Cray users group conference, Santa Fe, NM (United States), 23-27 Sep 1991). Order Number DE92000223. Source: OSTI; NTIS; GPO Dep.

Los Alamos National Laboratory is designing a High-Performance Data System (HPDS) that will provide storage for

supercomputers requiring large files and fast transfer speeds. The HPDS will meet the performance requirements by managing data transfers from high-speed storage systems connected directly to a high-speed network. File and storage management software will be distributed in workstations. Network protocols will ensure reliable, wide-area network data delivery to support long-distance distributed processing. 3 refs., 2 figs.

**35510** (LA-UR–91-2965) **Algebraic calculation of stroboscopic maps of ordinary, nonlinear differential equations.** Wackerbauer, R. (Max-Planck-Institut fuer Extraterrestrische Physik, Garching (Germany)); Huebler, A.; Mayer-Kress, G. Lawrence Livermore National Lab., CA (United States). 25 Jul 1991. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9105242–2: Experimental mathematics: computational issues in nonlinear science, Los Alamos, NM (United States), 20-24 May 1991). Order Number DE92000220. Source: OSTI; NTIS; GPO Dep.

The relation between the parameters of a differential equation and corresponding discrete maps are becoming increasingly important in the study of nonlinear dynamical systems. Maps are well adopted for numerical computation and several universal properties of them are known. Therefore some perturbation methods have been proposed to deduce them for physical systems, which can be modeled by an ordinary differential equation (ODE) with a small nonlinearity. A new iterative, rigorous algebraic method for the calculation of the coefficients of a Taylor expansion of a stroboscopic map from ODE's with not necessarily small nonlinearities is presented. It is shown analytically that most of the coefficients are small for a small integration time and grow slowly in the course of time if the flow vector field of the ODE is polynomial and if the ODE has fixed point in the origin. Approximations of different orders respectively of the rest term are investigated for several nonlinear systems. 31 refs., 16 figs.

**35511** (LBL–27493) **Database system support for simulation data.** Murphy, M.C. Lawrence Berkeley Lab., CA (United States). Jul 1989. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000654. Source: OSTI; NTIS; GPO Dep.

This report addresses database system issues arising in the design, implementation and execution of queuing simulation experiments. The primary goal is to identify new features for inclusion in a custom database system implemented using an extensible database system. Simulation data is first identified as a distinct subset of scientific data. An overview of the experimental process is then presented along with a survey of related simulation environments. A queuing simulation paradigm is described in detail in order to identify the distinguishing characteristics of queuing simulation data and the modes of manipulation. This is the basis for a traditional ER/Relational implementation, which in turn serves as the focus of a complete simulation environment. Difficulties encountered in the use of traditional implementation tools motivate the custom database system extensions. 37 refs., 5 figs., 2 tabs.

**35512** (LBL–29734) **From chaos to order: The MicroStar data acquisition and analysis system.** Rathbun, W. Lawrence Berkeley Lab., CA (United States). Mar 1991. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000663. Source: OSTI; NTIS; GPO Dep.

The MicroStar data acquisition and analysis software consists of several independent processes, although to the user it looks like a single program. These programs handle such functions as data acquisition (if any), data analysis, interactive display and data manipulation, and process monitoring and control. An overview of these processes and functions can be found in the paper as well as a more detailed description and users' guide.

**35513** (LBL–30695) **Reverse engineering tools for software: A small study.** Harvey, E.H. Jr. Lawrence Berkeley Lab., CA (United States). Oct 1990. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000650. Source: OSTI; NTIS; GPO Dep.

Reverse engineering would ideally reconstruct the design information from existing software. It would ideally populate a forward engineering system that would allow future developments to be done with a higher level tool. By contrast, reverse engineering is done often at LBL by a collection of manual means, such as reading the source codes and talking to experts in those codes, along with some disjointed tools to aid in this process. The following discussion provides some information about the various tools in use at LBL. Most of this information comes from my personal work at LBL, mostly for the Physics Division Time Projection Chamber experiment. This is only a small study. Much more work could and needs to be done in this area. In order to keep the scope limited I will try to stay away from detailed issues such as what type of methodology or technology is best. I know that there are many arguments in favor of the newest and latest technology, just as there are arguments for doing things in the old tried and true methods.

**35514** (NAL-TR–1086) **Development of magneto-optic disk operation managing programs for NS system.** Tsuchiya, M. (National Aerospace Laboratory, Tokyo (Japan)). National Aerospace Lab., Chofu, Tokyo (Japan). Nov 1990. 22p. (In Japanese). Order Number DE92709531. Source: OSTI; NTIS (US Sales Only).

For a large capacity storage of the research/development data base in National Aerospace Laboratory (Japan), a reloadable optical storage unit (OSU) was introduced and has been generally operated since 1989. In order to make the OSU available for external storage of user data sets in the numerical simulation system (NS system) also, OSU operation managing programs peculiarly for the NS system have been developed, which realize the transference of amount of data between magnetic and magneto-optic disks. One of the important functions of the programs is to convert user's data in variable format to fixed sector format in order to store them in the OSU. Another important function is user command languages by which the transference is easily implemented. Experiments have shown that the designed effectiveness of the OSU operation managing programs has been achieved. The results imply that utilization and convenience of the NS system are increased. 7 refs., 5 figs., 17 tabs.

**35515** (ORNL/TM–11850) **On finding minimum-diameter clique trees.** Blair, J.R.S. (Tennessee Univ., Knoxville, TN (United States). Dept. of Computer Science); Peyton, B.W. Oak Ridge National Lab., TN (United States). Aug 1991. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92000386. Source: OSTI; NTIS; GPO Dep.

It is well-known that any chordal graph can be represented as a clique tree (acyclic hypergraph, join tree). Since some chordal graphs have many distinct clique tree representations, it is interesting to consider which one is most desirable under various circumstances. A clique tree of minimum diameter (or height) is sometimes a natural candidate when choosing clique trees to be processed in a parallel computing environment. This paper introduces a linear time algorithm for computing a minimum-diameter clique tree. The new algorithm is an analogue of the natural greedy algorithm for rooting an ordinary tree in order to minimize its height. It has potential application in the development of parallel algorithms for both knowledge-based systems and the solution of sparse linear systems of equations. 31 refs., 7 figs.

**35516** (ORNL/TM–11910) **Economic analysis for the Integrated Booking System (IBS).** Truett, L.F. (Oak Ridge National Lab., TN (United States)); Wheeler, V.V. Oak Ridge National Lab., TN (United States). Aug 1991. 69p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE91018521. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Military Traffic Management Command's proposed Integrated Booking System (IBS) will provide automation support for movement of international surface cargo. IBS will operate during peacetime and wartime to book unit and nonunit cargo. This Economic Analysis (EA) provides draft cost estimates over a 10-year life cycle for four alternative strategies. The EA considered costs only for implementation and operation in the Continental United States although IBS will be implemented worldwide. Through the year 2004, costs for Alternative 1, maintain the status quo, are estimated at a total of $11,461,000. Costs for Alternative 2, modify the current systems, are estimated at $11,821,000. Costs for

Alternative 3, develop IBS with a client/server architecture, are estimated at $10,690,500. Costs for Alternative 4, develop IBS on a midrange mainframe computer with terminal access, are estimated at $10,622,900. Alternatives 3 and 4 are preferred from a technological and operational viewpoint as well as from a cost perspective. Alternative 3 provides additional benefits over Alternative 4 because of its downsizing capabilities. Thus, Alternative 3 is the recommended course of action. 25 refs., 4 tabs.

**35517** (PNL-SA-19923) **Education in computational science: Role of the national laboratories.** Dunning, T.H. Jr. Pacific Northwest Lab., Richland, WA (United States). Apr 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9104258-2: Workshop on undergraduate and graduate education in computational science, Baton Rouge, LA (United States), 29-30 Apr 1991). Order Number DE91018823. Source: OSTI; NTIS; GPO Dep.

The National Laboratories operated by the US Department of Energy have, since their very beginning, been at the forefront of research in computational science. Computational physics is at the core of the Department's programs to design nuclear weapons and to tame the fusion process. And, and the focal points of this research and development effort, the Los Alamos and Lawrence Livermore National Laboratories, support two of the largest computer centers in the world. More recently, the Office of Energy Research established the National Energy Research Supercomputer Center at Lawrence National Laboratory and cosponsored the Supercomputer Research Institute at Florida State University. These Centers provide supercomputer access to DOE's basic research programs, including chemistry, materials science, solid state physics nuclear physics, high energy physics, biology and environmental science. The availability of these resources has had a profound impact on these activities, permitting the solution of problems which have heretofore intractable. There is now underway at DOE's Pacific Northwest Laboratory a new research initiative which will have a profound impact on computational molecular science. The computing demands of new research programs are expect to grow dramatically over the next few years as new projects involving such as the molecular systems of increasing size and complexity are undertaken, new staff are added to the program, and extensive collabortive projects are initiated. To provide for the computing needs of these efforts, the computer hardware and software will need to provide state-of-the-art high performance computational and visualization capabilities for simulations while enabling the evaluation and exploitation of promising new computer technologies.

**35518** (SAND-91-1004) **Authentication of byte sequences.** Stearns, S.D. Sandia National Labs., Albuquerque, NM (United States). Jun 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92000150. Source: OSTI; NTIS; GPO Dep.

Algorithms for the authentication of byte sequences are described. The algorithms are designed to authenticate data in the Storage, Retrieval, Analysis, and Display (SRAD) Test Data Archive of the Radiation Effects and Testing Directorate (9100) at Sandia National Laboratories, and may be used in similar situations where authentication of stored data is required. The algorithms use a well-known error detection method called the Cyclic Redundancy Check (CRC). When a byte sequence is authenticated and stored, CRC bytes are generated and attached to the end of the sequence. When the authenticated data is retrieved, the authentication check consists of processing the entire sequence, including the CRC bytes, and checking for a remainder of zero. The error detection properties of the CRC are extensive and result in a reliable authentication of SRAD data.

**35519** (SAND-91-1037) **Thermal analysis report of the SANDAC V processor module.** Nelson, N.M. Sandia National Labs., Albuquerque, NM (United States). Aug 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE91018889. Source: OSTI; NTIS; GPO Dep.

The case and junction temperatures of selected integrated circuits (ICs) on the processor module of the SANDAC V computer were calculated using "BETAsoft-R," a personal computer, thermal analysis software program. The predicted data was then compared to corresponding IC case temperature measurements from laboratory tests of a functional SANDAC V computer. Although the difference between the actual and calculated values was somewhat higher than expected, the results of the analysis indicate that "BETAsoft-R" identified the critical ICs on the processor module and that it is capable of analyzing printed circuit boards for potential thermal problems before the design layout is finalized. 8 figs., 12 tabs.

**35520** (SAND-91-1168) **The implementation of a standards based heterogeneous network.** Eldridge, J.M.; Tolendino, L.F. Sandia National Labs., Albuquerque, NM (United States). 5 Aug 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92000608. Source: OSTI; NTIS; GPO Dep.

Computer networks, supporting an organization's activities, are prevalent and very important to the organization's mission. Implementing a heterogenous organizational network allows the staff to select the computing environment that best supports their job requirements. This paper outlines the lessons learned implementing a heterogenous computer network based on networking standards such as TCP/IP and Ethernet. Such a network is a viable alternative to a proprietary, vendor supported network and can provide all the functionality customers expect in a computer network. 2 figs.

**35521** (SAND-91-1252C) **Compile-time partitioning of a non-strict language with side-effects into sequential threads.** Hoch, J.E.; Davenport, D.M.; Grafe, V.G.; Steele, K.M. Sandia National Labs., Albuquerque, NM (United States). [1991]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-911230-1: 3. Institute of Electrical and Electronic Engineers (IEEE) symposium on parallel and distributed processing, Dallas, TX (United States), 1 Dec 1991). Order Number DE91013107. Source: OSTI; NTIS; GPO Dep.

This paper presents a practical algorithm for partitioning a program into sequential threads. A thread is a sequence of instructions, possibly including branches, which can be scheduled as an indivisible unit on a von Neumann-like processor. The partitioning algorithm is designed for a non-strict (but not lazy) language with non-strict data structures and side-effects. The primary target of the proposed compilation strategy is large-scale parallel systems which rely on multithreading at the processor level to tolerate long communication latencies. As such, the algorithm incorporates a mechanism to balance the desire to maximize thread length with the desire to expose useful high-level parallelism. Although this paper focuses on non-strict semantics in conjunction with a parallel multithreaded architecture, the partitioning analysis is equally well suited (with appropriate simplifications) to a non-strict language on a sequential machine or a strict language on a parallel multithreaded machine. Our analysis is accomplished without compromising non-strict semantics and without creating dependencies which sacrifice useful high-level parallelism. It can also exploit known dependency information. The analysis starts with a traditional dataflow graph and partitions it into a set of interrelated threads. 16 refs., 9 figs.

**35522** (SAND-91-1921C) **Shock wave codes at Sandia National Laboratories.** McGlaun, J.M. Sandia National Labs., Albuquerque, NM (United States). 20 Aug 1991. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9107138-2: 18. international symposium on shock waves, Sendai (Japan), 21-26 Jul 1991). Order Number DE91017847. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories is very active in developing multidimensional, multi-material shock wave physics codes. One example is the state-of-the-art, three-dimensional Eulerian code CTH which is used at numerous government and university sites. CTH is being ported to both Single Instruction Multiple Data (SIMD) and Multiple Instruction Multiple Data (MIMD) massively parallel computers. The next-generation arbitrary-Lagrangian-Eulerian code RHALE is under development. This paper will discuss these codes.

**35523** (SAND-91-1964C) **Effective path planning through task restriction.** Chen, P.C. Sandia National Labs., Albuquerque, NM (United States). 10 Sep 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789.

(CONF-9105260–1: IEEE conference on robotics and automation, Nice (France), 10 May 1991). Order Number DE91019066. Source: OSTI; NTIS; GPO Dep.

We present a simple and effective path planning algorithm, an essential component in facilitating robot programming, based on a series of plausible task restriction. It is designed to solve "realistic" problems very quickly, at the expense of not being able to solve every problem. First, the notion of "realistic" problems is motivated with heuristic arguments and formalized through task restrictions. Next, an algorithm solving the resulting tasks of interest is provided. We prove its corrections and theoretical efficiency, and demonstrate empirically its effectiveness and speed. We expect our algorithm to be of practical significance based on its simplicity and predicted performance. 9 refs., 7 figs.

**35524** (SAND–91-2115C) **NFS, Kerberos, and UNICOS.** Haynes, R.A. Sandia National Labs., Albuquerque, NM (United States). 25 Sep 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9109276–3: Cray users group conference, Santa Fe, NM (United States), 23-27 Sep 1991). Order Number DE92000246. Source: OSTI; NTIS; GPO Dep.

The Network File System (NFS) is used in UNIX-based networks to provide transparent file sharing between heterogeneous systems. Although NFS is well-known for being weak in security, it is widely used and has become a de facto standard. This paper examines the user authentication shortcomings of NFS and the approach Sandia National Laboratories has taken to strengthen it with Kerberos. The implementation on a Cray Y-MP8/864 running UNICOS is described and resource/performance issues are discussed. 4 refs., 4 figs.

**35525** (SAND–91-2116C) **Requirements for a Network Storage Service in a supercomputer environment.** Kelly, S.M. Sandia National Labs., Albuquerque, NM (United States). 26 Sep 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9109276–1: Cray users group conference, Santa Fe, NM (United States), 23-27 Sep 1991). Order Number DE92000245. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories has completed a requirements study for a networked mass storage system. The areas of user functionality, network connectivity, and performance were analyzed to determine specifications for a Network Storage Service to operate in supercomputer environment. 4 refs.

**35526** (SAND–91-2257C) **SRIM code management at Sandia National Laboratories.** Sullivan, T.D. Sandia National Labs., Albuquerque, NM (United States). [1991]. 20p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9110235–1: Intelligence community modeling group, Ann Arbor, MI (United States), 15-19 Oct 1991). Order Number DE92000952. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The report discusses the conversion of SRIM code to run on a cray XMP-4/16 under CTSS. Also discussed is the conted code. The CONTED Context Editor is a batch editor that makes changes to test files based on context rather than position. The editor applies a modification using as a point of reference a specified static group of text called a "tag," that appears in the base text file. It is designed to operate as a standard UNIX filter program, similar to SED. The tag concept provides for the specification of a more rigorous point of reference for modifications than a line number or pattern of text within a line. CONTED operates on sets of contiguous lines, or "groups," rather than on lines or patterns within a line. Since a group can be composed of a single line, CONTED can be made to operate on a line basis.

**35527** (UCID–17026-Rev.3) **TART and ALICE input manual: Revision 3.** Kimlinger, J.R.; Monson, N.L.; Plechaty, E.F. Lawrence Livermore National Lab., CA (United States). 25 Jan 1990. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000475. Source: OSTI; NTIS; GPO Dep.

This report lists the input for the TART code on the Cray and gives definitions for all input parameters. It also describes code execution, the limitations of the code, and the input for three sample problems.

**35528** (UCRL-JC–107491) **Implementing functional languages to exploit locality.** Wolski, R.; Feo, J.; Cann, D. Lawrence Livermore National Lab., CA (United States). [1991]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911230–2: 3. Institute of Electrical and Electronic Engineers (IEEE) symposium on parallel and distributed processing, Dallas, TX (United States), 1 Dec 1991). Order Number DE91015121. Source: OSTI; NTIS; GPO Dep.

In the quest for high performance, no obstacle has been as persistent or unyielding as memory latency. It was hoped that dataflow's fine-grain asynchronous model of execution might defeat the memory latency problem. Unable to realize efficient fine-grain systems, the dataflow community is now studying medium-grain and coarse-grain implementations which, like conventional execution models, suffer the effects of memory latency. In this paper, we describe a functional language implementation that automatically exploits locality on cache-coherent multiprocessors. Our system achieves performance improvements reaching 20% for some programs. This study lends further support to the superiority of the functional paradigm for parallel processing. 11 refs., 9 figs.

**35529** (UCRL-JC–108197) **Harnessing the killer micros: Applications from LLNL's massively parallel computing initiative.** Belak, J.F. Lawrence Livermore National Lab., CA (United States). Jul 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910799–1: Workshop on parallel computation in chemistry, Willowbrook, IL (United States), 17-19 Jul 1991). Order Number DE91018721. Source: OSTI; NTIS; GPO Dep.

Recent developments in microprocessor technology have led to performance on scalar applications exceeding traditional supercomputers. This suggests that coupling hundreds or even thousands of these "killer-micros" (all working on a single physical problem) may lead to performance on vector applications in excess of vector supercomputers. Also, future generation killer-micros are expected to have vector floating point units as well. The purpose of this paper is to present an overview of the parallel computing environment at Lawrence Livermore National Laboratory. However, the perspective is necessarily quite narrow and most of the examples are taken from the author's implementation of a large scale molecular dynamics code on the BBN-TC2000 at LLNL. Parallelism is achieved through a geometric domain decomposition – each processor is assigned a distinct region of space and all atoms contained therein. As the atomic positions evolve, the processors must exchange ownership of specific atoms. This geometric domain decomposition proves to be quite general and we highlight its application to image processing and hydrodynamics simulations as well. 10 refs., 6 figs.

**35530** (UCRL-LR–108186) **A domain decomposition algorithm for solving large elliptic problems.** Nolan, M.P. Lawrence Livermore National Lab., CA (United States). Jan 1991. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE92000096. Source: OSTI; NTIS; GPO Dep.

AN algorithm which efficiently solves large systems of equations arising from the discretization of a single second-order elliptic partial differential equation is discussed. The global domain is partitioned into not necessarily disjoint subdomains which are traversed using the Schwarz Alternating Procedure. On each subdomain the multigrid method is used to advance the solution. The algorithm has the potential to decrease solution time when data is stored across multiple levels of a memory hierarchy. Results are presented for a virtual memory, vector multiprocessor architecture. A study of choice of inner iteration procedure and subdomain overlap is presented for a model problem, solved with two and four subdomains, sequentially and in parallel. Microtasking multiprocessing results are reported for multigrid on the Alliant FX-8 vector-multiprocessor. A convergence proof for a class of matrix splittings for the two-dimensional Helmholtz equation is given. 70 refs., 3 figs., 20 tabs.

**35531** (UCRL-MA–105401) **TAURUS: An interactive post-processor for the analysis codes NIKE3D, DYNA3D, and TOPAZ3D.** Spelce, T. Lawrence Livermore National Lab., CA (United States). May 1991. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE91019012. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides an update to the user's manual for the TAURUS finite element analysis post processor. TAURUS is designed for use with the family of nonlinear finite element codes DYNA3D, NIKE3D, and TOPAZ3D developed in the Methods Development Group at Lawrence Livermore National Laboratory and the structural analysis code GEMINI. TAURUS provides the ability to display deformed geometries and contours or fringes of a large number of quantities on meshes consisting of beam, plate, shell, and solid type elements. Time history plotting is also available for a wide variety of primitive and derived quantities. TAURUS is operational on a variety of platforms from workstations to supercomputers. 13 refs., 47 figs.

**35532** (VTT-TIED–1210) **Navigation and positioning of mobile robots.** Maekelae, H. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Saehkoe- ja Automaatiotekniikan Lab.); Koskinen, K.; Annanpalo, J.; Penttinen, A. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Jan 1991. 93p. (In Finnish). Order Number DE92704014. Source: OSTI; NTIS (US Sales Only).

Dead reckoning was studied by combining the direction and distance measurements. Travelled distance was measured by using a microwave based Doppler radar and an odometer. Both these methods were quite accurate. The direction of the vehicle was measured by a magnetic compass. Its performance was degraded by the acceleration of the vehicle. Feasibility of ultrasonic sensors was tested for obstacle detection and contour following. The sensors tested were able to detect obstacles but they could not distinguish between various types of obstacles. Infrared switches were tested for detecting reflecting landmarks. Their operation proved to be very reliable for the application. An infrared distance sensor was used to obtain distance to nearby objects. The reflection properties of the object had a great effect on the reliability of the measurement. Artificial landmarks can be used for marking the route of a mobile robot. These landmarks can be detected by computer vision. The experiments for testing this principle gave promising results. The accelerations and tilts of the machine were monitored by accelerometers and inclinometers. A properly dampened inclinometer can be used for detecting dangerous tilts of a mobile robot. The natural frequency of the accelerometer has to be adjusted according to the vibrations of the vehicle body. Microwave techiques for measuring the vehicle position was studied in cooperation with Swedish Institute of Microelectronics. Laser techniques was also studied for accurate positioning.

**35533** (WHC-SA–1019) **Justification for reporting negative value counting results as an alternative to minimum detectable activity.** Troyer, G.L.; Brown, R.C.; Jones, R.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-910422–4: International topical conference on methods and applications of radioanalytical chemistry II (MARC-2), Kona, HI (United States), 21-27 Apr 1991). Order Number DE91018165. Source: OSTI; NTIS; GPO Dep.

Proper measurements of sample radioactivity require removal of background activity as a final step in generating an analytical result. When the sample response is within the standard deviation of the background activity, results often are reported as less than detectable or at a minimum detectable activity (MDA) value. Using the MDA creates a truncated distribution or censored data situation. Where a sample point has repeated measurements a bias is introduced. Further, real results can have analytical error statements. These error statements are lost when a MDA is reported. Investigation of a large number of net counting data for low activity sample points suggests that reporting negative results can provide more information than merely truncating to the MDA when results are near background activities. Four cases are examined: method performance, determination of low level activities, general background stability, and quality of results. 10 refs., 5 figs., 1 tab.

## 9903 Information Handling

**35534** (CONF-9105153–, pp. 1-4) **The energy data base: Why change its name?.** Grissom, M.C. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Reasons for building the Energy Science and Technology Database (EDB) and for changing its name are discussed. The range of information to be found there is described along with ways this information is used or can be used. How the database has changed and ways it may change are considered. Results from surveys of DIALOG and STN users of the database are reported.

**35535** (CONF-9105153–, pp. 5-16) **Hanford electronic library project.** Carter, N.G. (Pacific Northwest Lab., Richland, WA (USA)); Judy, J.R. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

This paper describes the Hanford Technical Library's Electronic Library Project which makes the library catalog, journal holdings, accession lists, and CD-ROM databases available on the local area network for Hanford site-wide access. The growing diversity of databases sources mixing LAN-based, online, and CD-ROM databases also requires new methods to repackage search results for users. This paper describes new software that merges and sorts citations from multiple databases, eliminates duplicates, matches citations against local holdings, and delivers a quality search product to the customer.

**35536** (CONF-9105153–, pp. 17-21) **From galleys to electronic pages in one fell swoop.** Condouris, R.A. (Lawrence Livermore National Lab., CA (USA)). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract W-7405-ENG-48. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Since 1981, our Technical Information Department has been producing reports using traditional publications methods. The author sets type in galleys, print galleys on RC paper, and lay out pages manually. Recently, we added to our Atex-Autologic publishing system three high-resolution, laser imagers; six laser printers; one laser plotter; two Adobe PostScript interpreters; and two Autologic Page-Image Processors, plus ancillary equipment. These additions transformed our traditional publishing shop into a '90s electronic publisher that outputs complete pages on RC paper or film. This transformation created technological and organizational perturbations (plus a few emotional moments).

**35537** (CONF-9105153–, pp. 23-26) **Progress in informal information management: The Central Technical File.** Pasterczyk, C.E. (Sandia National Labs., Livermore, CA (USA)). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

One objective of the Sandia Technical Library is to improve the management of unpublished, informal information to respond to...information needs and requirements. The Central Technical File (CTF) is an archive of informal documents in Sandia National Laboratories technical programs which has been maintained by the Technical Library since 1952. CTF serves as a corporate memory for the Laboratories. This paper will describe the progress made in the last year to help CTF better meet Library objectives.

**35538** (CONF-9105153–, pp. 27-28) **DOE software management integration at OSTI.** Gorman, P.L. USDOE Office of

Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The phaseout of the National Energy Software Center and subsequent integration of software management into the other scientific and technical information activities at OSTI will be discussed. This talk will address impacts to both those submitting and those receiving software packages. Discussions will center on reasons for the change in location, requirements for the new activity, services to be offered, and policy implications.

**35539** (CONF-9105153–, pp. 29-31) **The thesaurus: Not extinct after all.** Raridon, M.H. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The thesaurus is shown as a viable tool in the modern information arena. The past and present views of the thesauri in information science are explored. The use of a thesaurus in online searching is described briefly. OSTI's new thesaurus program expands the horizons of thesaurus building. This program will be demonstrated.

**35540** (CONF-9105153–, pp. 33-40) **The NEPA environmental review and compliance expert system.** Caton, G. (Oak Ridge National Lab., TN (USA)); Haas, R. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC05-84OR21400. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

A PC-based system is being developed to assist in the preparation of documentation for the National Environmental Protection Act requirements and other applicable Oak Ridge National Laboratory environmental, safety, and health standards. The system knowledge is contained in a database of regulations grouped into menus and programmed in question-and-answer logic that assigns measures to be taken. Information collected by the system is written to report files and to a database for administrative use.

**35541** (CONF-9105153–, pp. 41-47) **Operational factors in the creation of large full-text databases.** Dickey, L. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC01-87RW00084. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

This paper discusses the procedural, organizational, and administrative aspects of large-volume text conversion. The discussion summarizes lessons learned from the conversion of over 250,000 pages of hardcopy documents to digital text and image files. The paper provides a step-by-step analysis of the processes involved in production text conversion operations. Key factors considered are format retention, accuracy requirements, and cost.

**35542** (CONF-9105153–, pp. 59-64) **Team editing with a difference.** Anderson, F.O. (Allied-Signal, Inc., Kansas City, MO (USA)). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC04-76DP00613. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

At the Kansas City Plant, they are experimenting with a team approach to editing technical documents. Phase 1 begins the editing task by creating a file on our electronic editing system, formatting the document, obtaining artwork, and doing some light editing. Then Phase 2 takes that rough document and completes the job. Early indications are that we are reducing turn-around time and improving quality of the product. Also, the staff is showing less evidence of burnout.

**35543** (CONF-9105153–, pp. 65-68) **International information sharing through the Energy Technology Data Exchange.** Teague, T. (Labat-Anderson Inc., Oak Ridge, TN (USA)). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The International Energy Technology Data Exchange (ETDE) is an integral part of DOE's Scientific and Technical Information program. By providing a means for 14 nations to ppol and access summaries of energy reports, ETDE helps maintain a ready source of current information for researchers and policymakers alike. This presentation will focus on a history of the Exchange; its structure, services, and products; and its unique role in building a comprehensive, international database.

**35544** (CONF-9105153–, pp. 69-73) **Data Preparation - Productivity and quality.** Mennella, D.A. (Science Applications International Corp., McLean, VA (USA)); Nippert, D.A. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Data Preparation is often the most expensive portion of total life cycle cost of an information system. This paper describes an approach to studying data preparation activities to improve productivity and quality. The results presented were developed from an instrumental simulation of a full text, image, and cataloging data preparation process.

**35545** (CONF-9105153–, pp. 75-83) **DOE scientific and technical information program update.** Buchanan, W.L. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The DOE Office of Scientific and Technical Information (OSTI), AD-21, in conjunction with the DOE Office of Information Resources Management Policy, Plans, and Oversight (AD-24) and Information Technology Services and Operations (AD-25), provides Departmental and contractor elements a centralized resource in meeting their Information Resource Management (IRM) related requirements. Several topics of interest relating to the scientific and technical information aspect of this resource from a policy and service perspective are presented.

**35546** (CONF-9105153–, pp. 85-95) **Information technologies in today's information world.** Scott, R.L. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

This paper is a survey of what the author believes are important technology trend issues in the information science area. This survey deals with important desktop applications, which are increasingly becoming the primary drivers in the information processing environment. This paper also provides a brief view into the future technology applications OSTI is pursuing.

**35547** (CONF-9105153–, pp. 97-101) **A perspective of OSTI.** Blanton, J.M. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Each year TI Meeting attendees tend to ask specific questions about 'what's going on with OSTI' and generally ask for an 'update' on the organization's STI activities. As a result of this interest, a current 'perspective' is being provided this year by OSTI speakers in subject-specific INFOTECH sessions as well as in paper and subsequent TI Meeting presentations. This paper, 'A Perspective of OSTI,' will provide an overview of the organization; its relationship to DOE Headquarters; and information regarding staffing, expertise, capabilities, and services as well as brief information on major '91 activities and current initiatives.

**35548** (CONF-9105153–, pp. 103-110) **Selecting a relational database system with the user in mind: A methodology.** Hohenbrink, K. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The Office of Scientific and Technical Information (OSTI) is in the process of developing a set of criteria for selecting a relational database management system (RDBMS). Impact and benefit to the online client is of primary concern in this process. This session outlines a database selection method that solicits database clientele input and explains what happens after a relational database is in place. Discussions will include: Identifying the organization's database functional requirements, selecting a pilot project, testing the RDBMS against client needs, and realizing new opportunities.

**35549** (CONF-9105153–, pp. 111-116) **Photography and audio-visual management system overview.** Eads, A.C. (Westinghouse Hanford Co., Richland, WA (USA)). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC06-87RL10930. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The Hanford Site Photography and Audio-Visual department is automating work-order tracking, billing, inventory, work-flow management, and negative and video tape indexing. Low-resolution images of selected photos will be available to selected local area network users. From the department's perspective, the paper will describe the formal in-house development process, including determination of need, design analysis, technology assessment, documentation, peer review, costs, final design, programming, implementation, and testing.

**35550** (CONF-9105153–, pp. 117-120) **Technology transfer update.** Fornwall, M.D. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Improving US competitiveness is a national priority and a mission of the Department of Energy. DOE initiated an expanded technology transfer program following a Department-wide (including laboratories) planning effort. The program builds on the existing mechanisms and authorities provided by past technology transfer legislation and serves as the basis for the implementation of the US Competitiveness and Technology Transfer Act of 1989. The planning activities centered on many issues, including: Establishing mechanisms for implementing Cooperative Research and Development Agreements (CRADA), inventorying and discussing DOE (and contractor outreach activities), technology transfer training programs, and technology transfer from production and other nonlaboratory facilities.

**35551** (CONF-9105153–, pp. 121-124) **Developing and managing a communication workshops program.** Danko, J.E. (Pacific Northwest Lab., Richland, WA (USA)); Lee, V.E. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC06-76RL01830. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Pacific Northwest Laboratory has a Communication Workshops Program that currently offers several workshops to improve the writing and presentation skills of its staff. Drawing on their experience, the authors offer suggestions for developing and operating such a program. The discussion includes identifying the workshops, developing appropriate material, managing the program, and administering the workshops.

**35552** (CONF-9105153–, pp. 125-130) **ISDN: High-speed information network of the future(?).** Cook, R.F. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

Integrated Services Digital Network (ISDN) has been called the most significant advancement in telecommunications since replacement of the manual switchboard. The office of the not-so-distant future will see the 3-kHz analog telephone line replaced by high-speed digital services with integrated voice-data workstations on the same line. This paper provides a brief tutorial on ISDN, examines the forces driving and slowing its implementation, and concludes with speculation on ISDN's future.

**35553** (CONF-9105153–, pp. 131-140) **DOE STI User Needs Study - Overview of results.** Finnerty, A.B. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

This paper presents an overview of the results of the Scientific and Technical Information (STI) User Needs Study conducted by OSTI in 1990-91. The purpose of the study was to identify needs for information types, formats, and media within the overall DOE research and development community. Although the primary target population of this study was researchers and scientists (approximately 70% of all respondents), a number of managers and information professionals were also included. Over 700 responses were received from the more than 30 sites and facilities participating in the study.

**35554** (CONF-9105153–, pp. 141-145) **What's new in OSTI online.** Elliot, J.L. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

In order to facilitate searching of the Energy Science and Technology Database on the Integrated Technical Information System (ITIS), OSTI has developed a menu-driven, user-friendly interface called the OSTI Search-Aid Menus (OSAM). Meanwhile, the Joint Committee on Printing (JCP)/Government Printing Office (GPO) Pilot Project, designed to evaluate electronic dissemination of DOE research and development results to Depository Libraries and including a thorough test of the newly completed ITIS gateway and shared cataloging, is well into the implementation stage. SIS users gained a new, specialized database this year, the SIS Published Information Database (SPID). These developments and plans for the very near future, including a networking project with ESnet and a new ITIS screen that allows fast, direct access to the databases, mean that OSTI's online services continue to expand.

**35555** (CONF-9105153–, pp. 147-148) **The DOE research-in-progress file: A potential technology transfer medium.** Whitson, M.O. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

As a result of today's worldwide competition for the development of goods and services and to enhance US prominence in these markets, it is important that we assist US industry by keeping them knowledgeable of DOE R and D programs currently under way. Industry can use this information to pursue cooperative or cost-shared agreements or to further transform research results into viable products for the global marketplace. Your organization's role in building this file will be discussed. A demonstration of the file will also be given.

**35556** (CONF-9105153–, pp. 149-154) **Technical factors in the creation of large full-text databases.** Bradford, R.B. USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). 1991. DOE Contract AC01-87RW00084. From Infotech '91; Oak Ridge, TN (United States); 22-23 May 1991. In *INFOTECH '91: DOE Technical Information (TI) Meeting.* 153p. Order Number DE91018074. Source: OSTI; NTIS.

The use of optical character recognition devices in the creation of large full-text databases is discussed. The importance of the limitations on character accuracies of contemporary OCR devices are

noted. The use of multiple OCR devices in a differential processing scheme is described. This technique exploits the decorrelation of errors produced by OCR devices from multiple vendors. Experimental results from applying this technique to documents from the Licensing Support System prototype database are presented. Using plurality voting alone, the number of errors in the composite ASCII character stream are reduced by two-thirds in comparison to the output of the best individual device. Such error reductions would correspond to approximately a 50% reduction in the overall costs of converting the text from such hardcopy documents to electronic form. Extensions to the technique are discussed that can provide even greater savings.

**35557** (DOE/EIA–0204(91/04)) **Energy Information Administration New Releases, July 1991–August 1991.** Jacobus, P. (ed.); Springer, I. USDOE Energy Information Administration, Washington, DC (United States). 10 Sep 1991. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE91018838. Source: OSTI; NTIS; GPO; GPO Dep.

The newsletter "New Releases" describes the reports and activities by the Energy Information Administration during the previous month. This annotated information describes activities, publications, machine-readable data files, modeling programs, and data compilations, ordering information and order forms are included. (BM)

**35558** (DOE/ER–0500) **FEDIX: The on-line database retrieval service of Government information for colleges, universities, and other organizations: User's guide: Version 4.0, Release 1.0.** USDOE Office of Energy Research, Washington, DC (United States). Sum 1991. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE91018496. Source: OSTI; NTIS; GPO Dep.

FEDIX is an on-line information service that links the education community and the federal government to facilitate research, education, and services. The system provides accurate and timely federal agency information to colleges, universities, and other research organizations. There are no registration fees and no access charges for using FEDIX. The only cost involved is that of a phone call. Agencies participating in the FEDIX system include: Department of Energy (DOE), Federal Aviation Administration (FAA), National Aeronautics and Space Administration (NASA), Office of Naval Research (ONR), National Science Foundation (NSF), National Security Agency (NSA), Department of Commerce (DOC), Department of Education (DOEd), and Department of Housing and Urban Development (HUD). Additional government agencies are expected to join FEDIX in the near future. This guide is intended to help users access and utilize the FEDIX system. Because the system requires frequent updating, some menus and tables used as examples in this publication may not exactly match those displayed on the on-line system.

**35559** (JAERI-M–91-015, pp. 63-81) **6. Activities of the radiation shielding information center and a report on codes: Date for high energy radiation transport.** Roussin, R.W. (Oak Ridge National Lab., TN (USA). Radiation Shielding Information Center). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1991. (CONF-9010368–: 6. seminar on software development in nuclear energy research, Tokai (Japan), 31 Oct - 1 nov 1990). In *Proceedings of the sixth seminar on software development in nuclear energy research.* 194p. Order Number DE91780381. Source: OSTI; NTIS (US Sales Only); INIS.

There has been a strong collaboration between RSIC and the radiation transport community in Japan. From the early days, RSIC has been involved with high energy radiation transport, and over years, it has had interaction with many of the developers of high energy radiation transport computing technology and data libraries, and has been able to collect and disseminate this technology. The current status of this technology is reviewed, and the prospect for the new advancement is examined. RSIC is embedded in the Engineering Physics and Mathematics Division at Oak Ridge National Laboratory. In practice, RSIC is an information analysis center. RSIC has served several communities for their radiation transport needs, and its scope has broadened to include the radiation transport from nuclear weapons, radioisotopes, accelerators, fusion reactors, nuclear wastes, and both natural and man-made radiation in space. The placing of radiation transport literatures in the data base, the publication of reports and the holding of seminars and workshops are carried out. International collaboration and particularly that with Japan are reported. (K.I.).

**35560** (JAERI-M–91-098) **Introduction to SAS on VAX.** Kardaun, O. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); Miura, Yukitoshi; Matsuda, Toshiaki; Tamai, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1991. 42p. Order Number DE92704284. Source: OSTI; NTIS (US Sales Only); INIS.

To analyse, among others, the H-mode data base, a new version (6.06) of the SAS system has been installed on the VAX 3200 Workstation at JFT-2M. In this report, we summarize how to use SAS interactively (i.e., in 'display manager mode') on this machine. By a didactical example program and its annotated output we illustrate some of the capabilities of SAS. The report is intended to facilitate the access to the SAS documentation by physicists interested in plasma physical applications. (author).

**35561** (LBL–29576) **Data management in heterogeneous environments and its implications to CEDR.** Markowitz, V.M. Lawrence Berkeley Lab., CA (United States). 27 Oct 1990. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000651. Source: OSTI; NTIS; GPO Dep.

We investigate in this report the issue of data management across multiple pre-existing databases characterized by various degrees of heterogeneity. Different approaches to the problem of data management in heterogeneous environments are reviewed and their advantages and disadvantages are discussed. We examine in some detail the problem of schema integration involved in these approaches. We illustrate different aspects of data management in heterogeneous environments with examples from the Comprehensive Epidemiological Data Resource (CEDR) project, and conclude the report with recommendations for CEDR. These recommendations are summarized in this paper.

**35562** (LBL–30953) **MetaBrowser: A combined browsing, query, and analysis tool.** Shoshani, A.; Szeto, E. Lawrence Berkeley Lab., CA (United States). Apr 1991. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92000714. Source: OSTI; NTIS; GPO Dep.

The MetaBrowser design is based on the premise that scientists should not be forced to learn new languages or commands for finding the data they are interested in and for selecting subsets of the data for further analysis. Furthermore, there should be a single system that permits browsing, query, and analysis of the data, so that the scientist does not have to switch between systems. The current version for the MetaBrowser was designed for the DOE CEDR (Comprehensive Epidemiological Data Resource) project, but the same principles can apply to other scientific disciplines. Browsing and query should be combined. It is quite natural for a user to explore the information in the database before deciding what subset of the data to select for further analysis. In general, if there is a large number of datasets (i.e. databases) in the system, then the user would want to find out information about the various datasets (called metadata), before choosing one or more datasets for further exploration. Thus, a metadatabase that holds information about datasets in the systems must exist.

**35563** (SAND–91-1167) **A Sandia telephone database system.** Nelson, S.D.; Tolendino, L.F. Sandia National Labs., Albuquerque, NM (United States); Sandia National Labs., Livermore, CA (United States). Aug 1991. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE92000607. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories, Albuquerque, may soon have more responsibility for the operation of its own telephone system. The processes that constitute providing telephone service can all be improved through the use of a central data information system. We studied these processes, determined the requirements for a database system, then designed the first stages of a system that meets our needs for work order handling, trouble reporting, and ISDN hardware assignments. The design was based on an extensive set of applications that have been used for five years to

manage the Sandia secure data network. The system utilizes an Ingres database management system and is programmed using the Application-By-Forms tools.

**35564** (UCRL-JC–106995) **Rebels in search of champions: Envisioning the library of the future.** Moulik, A.; Lai, D. Lawrence Livermore National Lab., CA (United States). 21 Jun 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911243–1: 15. international online meeting, London (United Kingdom), 10-12 Dec 1991). Order Number DE91016606. Source: OSTI; NTIS; GPO Dep.

The traditional role of librarians to secure and provide access to the archives of recorded knowledge is being rapidly challenged on three fronts: the increasing technical sophistication of library users, the wide availability of information management software, and economic pressures on the growth of library collections. While we may argue endlessly about "turf" and "ownership", the real challenge is to forge a new ethic of librarianship which defies the stereotype of the passive provider of information services, explores new models of partnership with users, and champions an interactive environment in which to create the library of the future. The Main Library at Lawrence Livermore National Laboratory is actively engaged in testing experimental models of the library of the future, centered on dynamic user-librarian interactions, versatile information technologies, and on forecasting creative partnerships with library users in different environments. These experiments are described, evaluated, and their implications for future development are explored. 39 refs.

**35565** (WHC-EP–0506) **Program information architecture/ document hierarchy: Proposed.** Woods, T.W. Westinghouse Hanford Co., Richland, WA (United States). Sep 1991. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE92000529. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Waste Management System (NWMS) Management Systems Improvement Strategy (MSIS) (DOE 1990) requires that the information within the computer program and information management system be ordered into a precedence hierarchy for consistency. Therefore, the US Department of Energy (DOE). Office of Civilian Radioactive Waste Management (OCRWM) requested Westinghouse Hanford Company to develop a plan for NWMS program information which the MSIS calls a document hierarchy. This report provides the results of that effort and describes the management system as a "program information architecture." 3 refs., 3 figs.

# Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

Radiation-induced modification of inorganic materials with organic silicon compounds, 16:34557 (IA;SU;In Russian)
Radiation-sorption processing of phenol-containing waters. Mathematical model of the process, 16:33822 (IA;SU;In Russian)
Radiation-thermal processes in heterogeneous system brown coal-pentadecane, 16:34745 (IA;SU;In Russian)
Radiation-thermal transformations in heterogeneous system brown coal-methane, 16:34752 (IA;SU;In Russian)
Radiolysis and radiation-induced crosslinking of binding polymers of working layer of magnetic ribbons under accelerated electron irradiation, 16:34551 (IA;SU;In Russian)
Radiolysis of water adsorbed on specimens of commercial-grade silica gel, 16:34738 (IA;SU;In Russian)
Regularities and mechanism of radiation-induced atmospheric corrosion of metals, 16:34454 (IA;SU;In Russian)
Structural changes in nickel alloys during radiation heat treatments, 16:34451 (IA;SU;In Russian)
Study of oxidation processes in aqueous solutions of thiourea and thioacetamide, 16:34750 (IA;SU;In Russian)
Study of paramagnetic defects in irradiated aluminium oxides of various modifications, 16:34532 (IA;SU;In Russian)
Study of the process of radiation-adsorption disinfection of sewages, 16:33825 (IA;SU;In Russian)
Study on thermoradiation sterilization of sewages, 16:33824 (IA;SU;In Russian)
Thermography of climatically and radiation aged polymers, 16:34556 (IA;SU;In Russian)
Unadditivity under combined irradiation of zinc oxide-polymethyl siloxane system by ultraviolet radiation, protons and electrons, 16:34554 (IA;SU;In Russian)
X-ray diffraction study of structure of irradiated amorphous red phosphorus, 16:34558 (IA;SU;In Russian)

**AN SSSR, Moscow (USSR). Inst. Obshchej i Neorganicheskoj Khimii**

17. All-union Chugaev conference on complex compound chemistry. Pt. 3: Summaries of reports, 16:34579 (I;SU;In Russian)
9. All-union conference on chemistry of inorganic fluorides. Pt. 1: Summaries of reports, 16:34686 (I;SU)
Aluminohydride complexes of samarocene and lutetocene, 16:34634 (IA;SU;In Russian)
Ambidenticity of amides in indium (3) fluorocomplexes, 16:34632 (IA;SU;In Russian)
Applied aspects of niobium and tantalum fluoride chemistry, 16:34692 (IA;SU;In Russian)
Borolanthanum glasses with strontium and yttrium fluorides, 16:34562 (IA;SU;In Russian)
Certain properties of tetrafluoroboric acid of industrial value, 16:34720 (IA;SU;In Russian)
Complexing in iodate systems, 16:34652 (IA;SU;In Russian)
Complexing properties of amphiphilic ion exchangers modified with fatty acid anions, 16:34641 (IA;SU;In Russian)
Composition and structure of molybdenum complexes in aqueous and organic media and solid products, 16:34659 (IA;SU;In Russian)
Compound fluoride cross-luminescence, 16:35346 (IA;SU;In Russian)
Coordination compounds of immobile luminescent reagents with rare elements, 16:34660 (IA;SU;In Russian)
Copper borohydride complexes: synthesis, structure, properties, 16:34617 (IA;SU;In Russian)
Correlation between stereochemistry and circular dichroism spectra of transition metal chiral binuclear clusters, 16:34621 (IA;SU;In Russian)
Correlation of spectral properties of lanthanide $\beta$-diketonates with ligand structure, 16:34657 (IA;SU;In Russian)
Cross-luminescence in alkali metal fluorides under pulsed synchrotron radiation excitation, 16:35345 (IA;SU;In Russian)
Crystal preparation and study of dielectric properties of inorganic fluorides $AF_2$ (A=Ba, Sr, Pb, Cd), 16:34716 (IA;SU;In Russian)
Crystal-structure aspect of boron complex formation with trihydroxyglutaric acid with structures of $Sr_2(NH_4)(C_5H_4O_7)_2B\cdot 4H_2O$ and $(NH_4)_2Zn_2(H_2O)_2(C_{10}H_6O_{17}B_2)\cdot$, 16:34680 (IA;SU;In Russian)
Different-ligand complexes of oxovanadium and their behaviour in alcoholic solutions, 16:34662 (IA;SU;In Russian)
Dissociation enthalpies of complex molecules $MPbF_3$ (M=K, Rb, Cs), 16:34705 (IA;SU;In Russian)
Effect of nature of electroneutral ligands on composition and structure of $UO_2XO_4$center dotnL complexes, 16:34769 (IA;SU;In Russian)
Effect of rare earth acetylacetonate structure on their behaviour under conditions of vacuum sublimation, 16:34661 (IA;SU;In Russian)
Effect of secondary cations on structure of dimolybdatouranylate complexes, 16:34631 (IA;SU;In Russian)
Electric conductivity of solid electrolytes on the basis of $LaF_3$, 16:34703 (IA;SU;In Russian)
Electronic structure of Be and Mg oxo-complexes from quantum-chemical calculation data, 16:34624 (IA;SU;In Russian)
Features of structural chemistry of 3d metal (Eu(3) and $[UO_2]^{2+}$) complexes, 16:34765 (IA;SU;In Russian)
Features of structure of anion rare earth complexes with ethylenediaminetetraacetic, fluoride and carbonate ligands, 16:34627 (IA;SU;In Russian)
Features of structure of hexaaquomagnesium 2-carboxy-8-mercaptoquinolinate tetrahydrate and zirconium and hafnium 2-carboxy-8-mercaptoquinolinates, 16:34670 (IA;SU;In Russian)
Features of thiosulfate ion complexing with metals, 16:34655 (IA;SU;In Russian)
Fluoride and chloride metallurgy of refractory metals. Comparison, achievements, prospects, 16:34690 (IA;SU;In Russian)
Fragment analysis and X-ray spectra of complexes, 16:34614 (IA;SU;In Russian)
Heteronuclear complexing in $AlCl_3$-$MgCl_2$-LiCl-KCl and $ZnCl_2$-$CdCl_2$-LiCl-KCl melts, 16:34629 (IA;SU;In Russian)
High purity fluorides of elements for fiber optics, 16:34687 (IA;SU;In Russian)

High temperature treatment of fluoride niobium-and tantalum-containing solutions, 16:34693 (IA;SU;In Russian)
Influence of rare earth fluorides on structure formation in fluorozirconate glasses, 16:34536 (IA;SU;In Russian)
Inorganic fluorides with high electron affinity, 16:34691 (IA;SU;In Russian)
Instability of structure of polynuclear vanadium (5) oxocomplexes, 16:34633 (IA;SU;In Russian)
Intermolecular interactions in solutions of rare earth complexes with triketones, 16:34647 (IA;SU;In Russian)
Intramolecular tellurium-nitrogen coordination bond in 2-butyltellurobenzalanilines, 16:34651 (IA;SU;In Russian)
Investigation of ceramic high-temperature superconductors of Bi-Sr-Ca-Cu-O-F system, 16:34535 (IA;SU;In Russian)
Investigation of fluorination process of rare earth oxides by elemental fluorine, 16:34707 (IA;SU;In Russian)
Investigation of molybdenum (0) bisarene complexes in vapour phase by the method of electron absorption spectroscopy, 16:34645 (IA;SU;In Russian)
Investigation of phase equilibria in the systems uranium hexafluoride - fluorocarbons, 16:34773 (IA;SU;In Russian)
Investigation of rare metal ion complexing with butylphenol-formaldehyde oligomers by spectroscopy methods, 16:34643 (IA;SU;In Russian)
Investigation of the LiF-$BaF_2$-$YbF_3$ system, 16:34721 (IA;SU;In Russian)
Investigation of the mechanism of high purification of zirconium and hafnium tetrafluorides from transition metals, 16:34688 (IA;SU;In Russian)
Investigation of the processes of zircon concentrate fluorination with elemental fluorine and silicon tetrafluoride trapping by sodium carbonate, 16:34709 (IA;SU;In Russian)
Investigation of the reaction between sodium xenon difluoride, 16:34712 (IA;SU;In Russian)
Investigation of the slag reprocessing process of calcium thermal reduction smelting of rare earth and transition metal fluorides, 16:34560 (IA;SU;In Russian)
Investigation of triplet state of Gd(3) complexes with 1,10-phenanthroline by MROD method, 16:34672 (IA;SU;In Russian)
Investigation of tungsten hexafluoride purification by adsorption, 16:34706 (IA;SU;In Russian)
Investigation of uranyl selenate complexes with fluorides of some alkali metals and ammonium, 16:34772 (IA;SU;In Russian)
Kinetics of lithium tantalate dissolution in hydrofluoric and sulfuric acid mixture, 16:34722 (IA;SU;In Russian)
Kinetics of reduction of preseodymium and neodymium fluorides mixtures with calcium, 16:34711 (IA;SU;In Russian)
Lanthanide complexes with benzocryptand [2B.2.2], 16:34668 (IA;SU;In Russian)
Liquid-solid equilibrium in the system iodine pentafluoride-bromine trifluoride, 16:34701 (IA;SU;In Russian)
Manufacture, optical and electrical properties of $CdF_2$-$AlF_3$-$CdGeO_3$ system glasses, 16:34561 (IA;SU;In Russian)
Mo(6) complexonates with 1-hydroxyethylidenediphosphonic acid ($H_4L$), 16:34622 (IA;SU;In Russian)
Molybdenum and tungsten complexing in sodium metaphosphate base melts, 16:34618 (IA;SU;In Russian)
New noncentresymmetric compounds $M_5Nb_3OF_{18}$ (M=$NH_4$, K, Rb), 16:34695 (IA;SU;In Russian)
New thorium and uranium complexes containing two and three ligands-porphyrins: structure and reactivity, 16:34766 (IA;SU;In Russian)
Noble metal fluorides, 16:34689 (IA;SU;In Russian)
On reprocessing of hafnium tetrafluoride sublimation residues by fluoride method, 16:34708 (IA;SU;In Russian)
On rhenium interaction with thiosalicylic acid and some heterocyclic amines, 16:34671 (IA;SU;In Russian)
On some properties of potassium heptafluorotantalate ($K_2TaF_7$), 16:34697 (IA;SU;In Russian)
On structure and properties of lanthanide iodide complexes with carbamide and related ligands, 16:34675 (IA;SU;In Russian)
On structure of interaction products of cobalt, nickel, manganese and iron iodides with carbamide (acetamide) and iodine, 16:34678 (IA;SU;In Russian)
On the problem of fluorine impurity in rare metal oxide powders obtained by plasmochemical method, 16:34694 (IA;SU;In Russian)
Oxovanadium complexing with oxalic acid thioderivatives in pyridine-aqueous and aqueous solutions, 16:34644 (IA;SU;In Russian)
Phase equilibria in condensed system rhenium hexafluoride-hydrogen fluoride, 16:34700 (IA;SU;In Russian)
Polynuclear cluster compounds with systems of metal-metal delocalized bonds of high multiplicity, 16:34615 (IA;SU;In Russian)
Polynuclear complexing: relation of stereoeffects and structure, 16:34640 (IA;SU;In Russian)
Possibilities of electron spectroscopy application to study of rare earth compounds coordination polyhedrons in polycrystalline samples, 16:34673 (IA;SU;In Russian)
Preparation and analysis of high-purity xenon difluoride, 16:34713 (IA;SU;In Russian)
Preparation of fluoride products from the Kola titanium-and zirconium-containing raw materials, 16:34718 (IA;SU;In Russian)
Reaction between gaseous iodine heptafluoride and elementary bromine, 16:34724 (IA;SU;In Russian)
Reaction of sodium in carbon with fluorine-containing compounds, 16:34726 (IA;SU;In Russian)
Reactions of binuclear ruthenium (2,3) sulfate with metal-metal bond, 16:34619 (IA;SU;In Russian)
Rhenium (5) oxohalide complexes with thiosemicarbazide, 16:34650 (IA;SU;In Russian)
Role of hydrogen bonds in reactivity of nitroso complexes, 16:34613 (IA;SU;In Russian)
Role of structure factor in complexing processes of rare earth ions, 16:34658 (IA;SU;In Russian)
Ruthenium complexing with functional groups of POLYORGS sorbents, 16:34679 (IA;SU;In Russian)
Semiempirical calculation of d-d spectra of transition metal hexaaquacomplexes with local account of electron correlation, 16:34646 (IA;SU;In Russian)
Sensitization effect in rare earth complexes on the basis of aprotic inorganic solvents, 16:34628 (IA;SU;In Russian)
Similarity and differences of structure, stability and structural nonrigidity of metal borohydrides and aluminohydrides, 16:34623 (IA;SU;In Russian)
Some data on hydroxide compounds of pentavalent neptunium and americium, 16:34770 (IA;SU;In Russian)
Spectral study of interionic interactions, structure and dynamics of anions in some complex fluorides, 16:34648 (IA;SU;In Russian)
Spectrochemical study of platinum (4) hexaiodates with different second-sphere cations, 16:34635 (IA;SU;In Russian)
Stability of fluoride niobium (5) complexes in halide melts, 16:34698 (IA;SU;In Russian)
Structural features of aqueous solutions of sodium chromate and tungstate from X-ray diffraction data, 16:34654 (IA;SU;In Russian)
Structural features of palladium, manganese, cadmium and cobalt complexes with pyrazole derivatives, 16:34638 (IA;SU;In Russian)
Structure and state of molybdenyl (6) complexes with some diols in nonpolar solvents, 16:34666 (IA;SU;In Russian)
Structure of $Cd^{2+}$ hydrate complexes in cadmium sulfate aqueous solutions from the data on X-ray diffraction, 16:34636 (IA;SU;In Russian)
Structure of metal coordination compounds with hydrazides containing different functional groups, 16:34625 (IA;SU;In Russian)
Structure of Mo(6) dioxocomplexes with Schiff bases on the basis of acylhydrazones of salicylic aldehyde, 16:34674 (IA;SU;In Russian)
Structure of polycrystalline perrhenates from $^{185,187}$Re NQR data, 16:34665 (IA;SU;In Russian)
Structure of three monooxychloride transition metal complexes with 18-crown-6, 16:34637 (IA;SU;In Russian)
Structure of [$Co(DH)_2Py_2$]center dot[$InPy_2Cl_4$] and [$Co(DfH)_2(4\text{-}pic)_2$]center dot[$In(4\text{-}pic)_2Cl_4$] and their electrical properties, 16:34664 (IA;SU;In Russian)
Structure, complexing abilities of triazole- and tetrazole-containing azomethines, 16:34630 (IA;SU;In Russian)
Study of boron complexing with hydroxyethylidenediphosphonic acid by the $^{11}$B, $^{31}$P NMR method, 16:34639 (IA;SU;In Russian)

Study of complexes formed with complexones of aminocarboxylic and aminophosphonic series by $^{13}C$ and $^{31}P$ NMR method with the use of paramagnetic selective relaxants, 16:34656 (IA;SU;In Russian)
Study of complexing processes during alloyage of solid electrolytes by copolymers with silver-iodine-copolymer system as example, 16:34682 (IA;SU;In Russian)
Study of different-ligand vanadium coplexes with chromophore reagents of anthraquinone series and cationic surfactants, 16:34649 (IA;SU;In Russian)
Study of formation amd properties of complexex in the system $ZrO_2$-$H_2SO_4$-$NH_4F$-$H_2O$, 16:34719 (IA;SU;In Russian)
Study of nitrogen- and sulfur-containing copolymer complexing with iodine, 16:34681 (IA;SU;In Russian)
Study of $O_2F$-radical interaction with uranium tetrafluoride and uranyl fluoride, 16:34771 (IA;SU;In Russian)
Subnanosecond scintillators based on alkali metal and alkali earth metal fluorides, 16:35344 (IA;SU;In Russian)
Synthesis and certain physico-chemical properties of lanthanum and yttrium dichlorofluorides, 16:34715 (IA;SU;In Russian)
Synthesis and crystal structure of copper and cadmium coordination compounds with isomeric 1- and 2-substituted tetrazoles, 16:34626 (IA;SU;In Russian)
Synthesis and growth of optical crystals $Na_{0.4}(Ln,Y)_{0.6}F_{2.2}$, 16:34704 (IA;SU;In Russian)
Synthesis and physicochemical properties of acid potassium hexafluorohafnate, 16:34717 (IA;SU;In Russian)
Synthesis and properties of volatile $\beta$-diketonates and imino-$\beta$-diketonates of Ca, Sr, Ba and their adducts, 16:34676 (IA;SU;In Russian)
Synthesis and structure of chelates of zinc and rare earths with 2-formylcyclohexanones, 16:34677 (IA;SU;In Russian)
Synthesis and structure of four heterometallic V, Nb and W-containing complexes - $Fe_2S_2(CO)_6$ derivatives, 16:34616 (IA;SU;In Russian)
Synthesis and study of rare earth tris-tetraethyliminodiphosphates, 16:34642 (IA;SU;In Russian)
Synthesis and study of ternary compounds $C_xF$-$HalF_n$-HF ($HalF_n$=$BrF_3$, $BrF_5$, $IF_5$), 16:34723 (IA;SU;In Russian)
Synthesis of complex fluorides showing promise as materials for ionizing radiation detectors on the basis of cross-luminescence phenomenon, 16:34702 (IA;SU;In Russian)
Synthesis of graphite interaction compounds of general formula $C_nMF$ and $(CF_x)_nMF$, 16:34727 (IA;SU;In Russian)
Synthesis of iodine heptafluoride, 16:34725 (IA;SU;In Russian)
Synthesis, properties and crystal structure of double salts on the basis of thiocyanates tris(ethylenediaminates) of some metals, 16:34663 (IA;SU;In Russian)
Synthesis, structure and properties of complexes of zinc tetrahydroborate with tetrahydroborates of organic cations, 16:34620 (IA;SU;In Russian)
The preparation technology of tungsten hexafluoride of pure reagent grade, 16:34559 (IA;SU;In Russian)
Thermal decomposition of $(NH_4)_3NbOF_6$, 16:34696 (IA;SU;In Russian)
Thermodynamics of lower fluorides of niobium and tantalum $NbF_{2.5}$, $NbF_4$, $TaF_3$, 16:34699 (IA;SU;In Russian)
Transition metal ion complexing with polyoxomolybdate $[Al(OH)_6Mo_6O_{18}]^{3-}$ according to $^{17}O$ and $^{95}Mo$ NMR, M=$Zn^{2+}$-$Mn^{2+}$, 16:34667 (IA;SU;In Russian)
Trivalent uranium complexing with crown ethers, 16:34768 (IA;SU;In Russian)
Use of ionic conductors on the basis of lanthanum fluoride for developing chemical sensors, 16:34714 (IA;SU;In Russian)
Use of xenon difluoride for oxygen extraction and determination in superconducting ceramics $YBa_2Cu_3O_{7-x}$, 16:34591 (IA;SU;In Russian)
Vanadium (5) and iron (3) complexes with Meerwein ester, their structure and analytical features, 16:34653 (IA;SU;In Russian)
Vibrational and luminescence spectra of uranyl derivatives of diacid acids with donor ligands, 16:34767 (IA;SU;In Russian)
Volume desublimation of zirconium tetrafluoride, 16:34710 (IA;SU;In Russian)
X-ray diffraction and quantum-chemical study of donor-acceptor complexes, $B_{10}H_{12}L_2$, 16:34669 (IA;SU;In Russian)
X-ray diffraction study of metal alcoholates, 16:34612 (IA;SU;In Russian)

**AN SSSR, Moscow (USSR). Nauchnyj Sovet po Khimii Vysokikh Ehnergij**

5. All-union conference on radiation heterogeneous processes. Part 2: Summaries of reports, 16:35342 (I;SU;In Russian)
Application of radiation-heterogeneous processes to improve the efficiency of sewage treatment, 16:34754 (IA;SU;In Russian)
Arsenic recovery from waste water of arsenic production industry, 16:33823 (IA;SU;In Russian)
Copper recovery from waste water of electrolytic metallurgy by radiation-chemical method, 16:34760 (IA;SU;In Russian)
Deformability and strength properties of irradiated polyethylene with heterogeneous net of lateral bonds, 16:34553 (IA;SU;In Russian)
Diffuse reflection electron spectroscopy study of radiolysis of alumonickelmolybdenum oxide systems in accelerated electron beam, 16:34737 (IA;SU;In Russian)
Effect of $\gamma$-radiation on the structure of nitrocellulose, 16:34744 (IA;SU;In Russian)
Effect of positron irradiation on lifetime of alkali halogen crystal in electric field, 16:35343 (IA;SU;In Russian)
Effect of the radiolysis of NaA and NaY zeolites on the adsorption properties, 16:34749 (IA;SU;In Russian)
Equilibrium dynamics of radiosorption purification of soluble chemical contaminants. Peculiarities of the process proceeding in non-linear region of convex sorption isotherm, 16:34747 (IA;SU;In Russian)
Feasibility study of radiation-chemical processing of waster water from Khimprom production association, 16:34753 (IA;SU;In Russian)
Ferrite ceramics sintering under irradiation, 16:34534 (IA;SU;In Russian)
Impurity diffusion in nuclear doped silicon, 16:34453 (IA;SU;In Russian)
Influence of $\gamma$-radiation on thermal stability of disperse oxide phase in nickel, 16:34452 (IA;SU;In Russian)
Intensification of ion exchange processes under the action of external fields, 16:34684 (IA;SU;In Russian)
Investigation of endothermic catalytic reactions in the radiation field of electron accelerator, 16:34756 (IA;SU;In Russian)
Joint action of ionizing radiation and radiolytic ozone on acetone aqueous solutions, 16:34755 (IA;SU;In Russian)
Material balance of radiation-adsorption removal of chlorophos on AG-3 charcoal in the flow, 16:34746 (IA;SU;In Russian)
On phase transformation in silicon dioxide under reactor radiation, 16:34533 (IA;SU;In Russian)
Peculiar features of optical degradation of $ZrO_2$+polymethylsiloxane system under separate and combined ultraviolet and electron irradiation, 16:34555 (IA;SU;In Russian)
Photo- and heat stimulated processes in coordination compounds of metals with dimethyl sulfoxide and dimethyl formamide, 16:34685 (IA;SU;In Russian)
Photochemical transformations in heterogeneous system silver-cadmium iodide, 16:34683 (IA;SU;In Russian)
Prediction of radiation properties of polymers using increment method, 16:34743 (IA;SU;In Russian)
Preparation of high purity metals by radiolysis of inorganic azides, 16:34751 (IA;SU;In Russian)
Preparation of manganese dioxide from manganese salt solutions in the field of radiation, 16:34758 (IA;SU;In Russian)
Processes of cadmium ion radiolytic precipitation in cadmium-containing solutions of electrolytic production, 16:34739 (IA;SU;In Russian)
Purification of aluminium oxide catalysts in the process of radiation-heat treatment, 16:34748 (IA;SU;In Russian)
Radiation effects in composite materials on polymer mixture base, 16:34759 (IA;SU;In Russian)
Radiation induced copolymerization of 2-methyl-5-vinyltetrazole with N-alkylamines, 16:34740 (IA;SU;In Russian)
Radiation induced destruction of nitrocellulose in heterogeneous and homogeneous media, 16:34741 (IA;SU;In Russian)

Radiation induced polymerization of 2-methyl-5-vinyltetrazole in homogeneous and heterogeneous media, 16:34742 (IA;SU;In Russian)
Radiation protection of physical and mechanical properties of nitrocellulose films, 16:34552 (IA;SU;In Russian)
Radiation-adsorption removal of pesticides at the pilot plant for sewage processing, 16:33826 (IA;SU;In Russian)
Radiation-chemical transformations in heterogeneous systems containing elementary phosphorus, 16:34757 (IA;SU;In Russian)
Radiation-induced modification of inorganic materials with organic silicon compounds, 16:34557 (IA;SU;In Russian)
Radiation-sorption processing of phenol-containing waters. Mathematical model of the process, 16:33822 (IA;SU;In Russian)
Radiation-thermal processes in heterogeneous system brown coal-pentadecane, 16:34745 (IA;SU;In Russian)
Radiation-thermal transformations in heterogeneous system brown coal-methane, 16:34752 (IA;SU;In Russian)
Radiolysis and radiation-induced crosslinking of binding polymers of working layer of magnetic ribbons under accelerated electron irradiation, 16:34551 (IA;SU;In Russian)
Radiolysis of water adsorbed on specimens of commercial-grade silica gel, 16:34738 (IA;SU;In Russian)
Regularities and mechanism of radiation-induced atmospheric corrosion of metals, 16:34454 (IA;SU;In Russian)
Structural changes in nickel alloys during radiation heat treatments, 16:34451 (IA;SU;In Russian)
Study of oxidation processes in aqueous solutions of thiourea and thioacetamide, 16:34750 (IA;SU;In Russian)
Study of paramagnetic defects in irradiated aluminium oxides of various modifications, 16:34532 (IA;SU;In Russian)
Study of the process of radiation-adsorption disinfection of sewages, 16:33825 (IA;SU;In Russian)
Study on thermoradiation sterilization of sewages, 16:33824 (IA;SU;In Russian)
Thermography of climatically and radiation aged polymers, 16:34556 (IA;SU;In Russian)
Unadditivity under combined irradiation of zinc oxide-polymethyl siloxane system by ultraviolet radiation, protons and electrons, 16:34554 (IA;SU;In Russian)
X-ray diffraction study of structure of irradiated amorphous red phosphorus, 16:34558 (IA;SU;In Russian)

**AN SSSR, Moscow (USSR). Nauchnyj Sovet po Neorganicheskoj Khimii**

17. All-union Chugaev conference on complex compound chemistry. Pt. 3: Summaries of reports, 16:34579 (I;SU;In Russian)
9. All-union conference on chemistry of inorganic fluorides. Pt. 1: Summaries of reports, 16:34686 (I;SU)
Aluminohydride complexes of samarocene and lutetocene, 16:34634 (IA;SU;In Russian)
Ambidenticity of amides in indium (3) fluorocomplexes, 16:34632 (IA;SU;In Russian)
Applied aspects of niobium and tantalum fluoride chemistry, 16:34692 (IA;SU;In Russian)
Borolanthanum glasses with strontium and yttrium fluorides, 16:34562 (IA;SU;In Russian)
Certain properties of tetrafluoroboric acid of industrial value, 16:34720 (IA;SU;In Russian)
Complexing in iodate systems, 16:34652 (IA;SU;In Russian)
Complexing properties of amphiphilic ion exchangers modified with fatty acid anions, 16:34641 (IA;SU;In Russian)
Composition and structure of molybdenum complexes in aqueous and organic media and solid products, 16:34659 (IA;SU;In Russian)
Compound fluoride cross-luminescence, 16:35346 (IA;SU;In Russian)
Coordination compounds of immobile luminescent reagents with rare elements, 16:34660 (IA;SU;In Russian)
Copper borohydride complexes: synthesis, structure, properties, 16:34617 (IA;SU;In Russian)
Correlation between stereochemistry and circular dichroism spectra of transition metal chiral binuclear clusters, 16:34621 (IA;SU;In Russian)
Correlation of spectral properties of lanthanide $\beta$-diketonates with ligand structure, 16:34657 (IA;SU;In Russian)
Cross-luminescence in alkali metal fluorides under pulsed synchrotron radiation excitation, 16:35345 (IA;SU;In Russian)
Crystal preparation and study of dielectric properties of inorganic fluorides $AF_2$ (A=Ba, Sr, Pb, Cd), 16:34716 (IA;SU;In Russian)
Crystal-structure aspect of boron complex formation with trihydroxyglutaric acid with structures of $Sr_2(NH_4)(C_5H_4O_7)_2B\cdot 4H_2O$ and $(NH_4)_2Zn_2(H_2O)_2(C_{10}H_6O_{17}B_2)\cdot$, 16:34680 (IA;SU;In Russian)
Different-ligand complexes of oxovanadium and their behaviour in alcoholic solutions, 16:34662 (IA;SU;In Russian)
Dissociation enthalpies of complex molecules $MPbF_3$ (M=K, Rb, Cs), 16:34705 (IA;SU;In Russian)
Effect of nature of electroneutral ligands on composition and structure of $UO_2XO_4$center dotnL complexes, 16:34769 (IA;SU;In Russian)
Effect of rare earth acetylacetonate structure on their behaviour under conditions of vacuum sublimation, 16:34661 (IA;SU;In Russian)
Effect of secondary cations on structure of dimolybdatouranylate complexes, 16:34631 (IA;SU;In Russian)
Electric conductivity of solid electrolytes on the basis of $LaF_3$, 16:34703 (IA;SU;In Russian)
Electronic structure of Be and Mg oxo-complexes from quantum-chemical calculation data, 16:34624 (IA;SU;In Russian)
Features of structural chemistry of 3d metal (Eu(3) and $[UO_2]^{2+}$) complexes, 16:34765 (IA;SU;In Russian)
Features of structure of anion rare earth complexes with ethylenediaminetetraacetic, fluoride and carbonate ligands, 16:34627 (IA;SU;In Russian)
Features of structure of hexaaquomagnesium 2-carboxy-8-mercaptoquinolinate tetrahydrate and zirconium and hafnium 2-carboxy-8-mercaptoquinolinates, 16:34670 (IA;SU;In Russian)
Features of thiosulfate ion complexing with metals, 16:34655 (IA;SU;In Russian)
Fluoride and chloride metallurgy of refractory metals. Comparison, achievements, prospects, 16:34690 (IA;SU;In Russian)
Fragment analysis and X-ray spectra of complexes, 16:34614 (IA;SU;In Russian)
Heteronuclear complexing in $AlCl_3$-$MgCl_2$-LiCl-KCl and $ZnCl_2$-$CdCl_2$-LiCl-KCl melts, 16:34629 (IA;SU;In Russian)
High purity fluorides of elements for fiber optics, 16:34687 (IA;SU;In Russian)
High temperature treatment of fluoride niobium-and tantalum-containing solutions, 16:34693 (IA;SU;In Russian)
Influence of rare earth fluorides on structure formation in fluorozirconate glasses, 16:34536 (IA;SU;In Russian)
Inorganic fluorides with high electron affinity, 16:34691 (IA;SU;In Russian)
Instability of structure of polynuclear vanadium (5) oxocomplexes, 16:34633 (IA;SU;In Russian)
Intermolecular interactions in solutions of rare earth complexes with triketones, 16:34647 (IA;SU;In Russian)
Intramolecular tellurium-nitrogen coordination bond in 2-butyltellurobenzalanilines, 16:34651 (IA;SU;In Russian)
Investigation of ceramic high-temperature superconductors of Bi-Sr-Ca-Cu-O-F system, 16:34535 (IA;SU;In Russian)
Investigation of fluorination process of rare earth oxides by elemental fluorine, 16:34707 (IA;SU;In Russian)
Investigation of molybdenum (0) bisarene complexes in vapour phase by the method of electron absorption spectroscopy, 16:34645 (IA;SU;In Russian)
Investigation of phase equilibria in the systems uranium hexafluoride - fluorocarbons, 16:34773 (IA;SU;In Russian)
Investigation of rare metal ion complexing with butylphenol-formaldehyde oligomers by spectroscopy methods, 16:34643 (IA;SU;In Russian)
Investigation of the LiF-$BaF_2$-$YbF_3$ system, 16:34721 (IA;SU;In Russian)
Investigation of the mechanism of high purification of zirconium and hafnium tetrafluorides from transition metals, 16:34688 (IA;SU;In Russian)
Investigation of the processes of zircon concentrate fluorination with elemental fluorine and silicon tetrafluoride trapping by sodium carbonate, 16:34709 (IA;SU;In Russian)

Investigation of the reaction between sodium xenon difluoride, 16:34712 (IA;SU;In Russian)
Investigation of the slag reprocessing process of calcium thermal reduction smelting of rare earth and transition metal fluorides, 16:34560 (IA;SU;In Russian)
Investigation of triplet state of Gd(3) complexes with 1,10-phenanthroline by MROD method, 16:34672 (IA;SU;In Russian)
Investigation of tungsten hexafluoride purification by adsorption, 16:34706 (IA;SU;In Russian)
Investigation of uranyl selenate complexes with fluorides of some alkali metals and ammonium, 16:34772 (IA;SU;In Russian)
Kinetics of lithium tantalate dissolution in hydrofluoric and sulfuric acid mixture, 16:34722 (IA;SU;In Russian)
Kinetics of reduction of preseodymium and neodymium fluorides mixtures with calcium, 16:34711 (IA;SU;In Russian)
Lanthanide complexes with benzocryptand [2B.2.2], 16:34668 (IA;SU;In Russian)
Liquid-solid equilibrium in the system iodine pentafluoride-bromine trifluoride, 16:34701 (IA;SU;In Russian)
Manufacture, optical and electrical properties of $CdF_2$-$AlF_3$-$CdGeO_3$ system glasses, 16:34561 (IA;SU;In Russian)
Mo(6) complexonates with 1-hydroxyethylidenediphosphonic acid ($H_4L$), 16:34622 (IA;SU;In Russian)
Molybdenum and tungsten complexing in sodium metaphosphate base melts, 16:34618 (IA;SU;In Russian)
New noncentresymmetric compounds $M_5Nb_3OF_{18}$ (M=$NH_4$, K, Rb), 16:34695 (IA;SU;In Russian)
New thorium and uranium complexes containing two and three ligands-porphyrins: structure and reactivity, 16:34766 (IA;SU;In Russian)
Noble metal fluorides, 16:34689 (IA;SU;In Russian)
On reprocessing of hafnium tetrafluoride sublimation residues by fluoride method, 16:34708 (IA;SU;In Russian)
On rhenium interaction with thiosalicylic acid and some heterocyclic amines, 16:34671 (IA;SU;In Russian)
On some properties of potassium heptafluorotantalate ($K_2TaF_7$), 16:34697 (IA;SU;In Russian)
On structure and properties of lanthanide iodide complexes with carbamide and related ligands, 16:34675 (IA;SU;In Russian)
On structure of interaction products of cobalt, nickel, manganese and iron iodides with carbamide (acetamide) and iodine, 16:34678 (IA;SU;In Russian)
On the problem of fluorine impurity in rare metal oxide powders obtained by plasmochemical method, 16:34694 (IA;SU;In Russian)
Oxovanadium complexing with oxalic acid thioderivatives in pyridine-aqueous and aqueous solutions, 16:34644 (IA;SU;In Russian)
Phase equilibria in condensed system rhenium hexafluoride-hydrogen fluoride, 16:34700 (IA;SU;In Russian)
Polynuclear cluster compounds with systems of metal-metal delocalized bonds of high multiplicity, 16:34615 (IA;SU;In Russian)
Polynuclear complexing: relation of stereoeffects and structure, 16:34640 (IA;SU;In Russian)
Possibilities of electron spectroscopy application to study of rare earth compounds coordination polyhedrons in polycrystalline samples, 16:34673 (IA;SU;In Russian)
Preparation and analysis of high-purity xenon difluoride, 16:34713 (IA;SU;In Russian)
Preparation of fluoride products from the Kola titanium-and zirconium-containing raw materials, 16:34718 (IA;SU;In Russian)
Reaction between gaseous iodine heptafluoride and elementary bromine, 16:34724 (IA;SU;In Russian)
Reaction of sodium in carbon with fluorine-containing compounds, 16:34726 (IA;SU;In Russian)
Reactions of binuclear ruthenium (2,3) sulfate with metal-metal bond, 16:34619 (IA;SU;In Russian)
Rhenium (5) oxohalide complexes with thiosemicarbazide, 16:34650 (IA;SU;In Russian)
Role of hydrogen bonds in reactivity of nitroso complexes, 16:34613 (IA;SU;In Russian)
Role of structure factor in complexing processes of rare earth ions, 16:34658 (IA;SU;In Russian)
Ruthenium complexing with functional groups of POLYORGS sorbents, 16:34679 (IA;SU;In Russian)
Semiempirical calculation of d-d spectra of transition metal hexaaquacomplexes with local account of electron correlation, 16:34646 (IA;SU;In Russian)
Sensitization effect in rare earth complexes on the basis of aprotic inorganic solvents, 16:34628 (IA;SU;In Russian)
Similarity and differences of structure, stability and structural nonrigidity of metal borohydrides and aluminohydrides, 16:34623 (IA;SU;In Russian)
Some data on hydroxide compounds of pentavalent neptunium and americium, 16:34770 (IA;SU;In Russian)
Spectral study of interionic interactions, structure and dynamics of anions in some complex fluorides, 16:34648 (IA;SU;In Russian)
Spectrochemical study of platinum (4) hexaiodates with different second-sphere cations, 16:34635 (IA;SU;In Russian)
Stability of fluoride niobium (5) complexes in halide melts, 16:34698 (IA;SU;In Russian)
Structural features of aqueous solutions of sodium chromate and tungstate from X-ray diffraction data, 16:34654 (IA;SU;In Russian)
Structural features of palladium, manganese, cadmium and cobalt complexes with pyrazole derivatives, 16:34638 (IA;SU;In Russian)
Structure and state of molybdenyl (6) complexes with some diols in nonpolar solvents, 16:34666 (IA;SU;In Russian)
Structure of $Cd^{2+}$ hydrate complexes in cadmium sulfate aqueous solutions from the data on X-ray diffraction, 16:34636 (IA;SU;In Russian)
Structure of metal coordination compounds with hydrazides containing different functional groups, 16:34625 (IA;SU;In Russian)
Structure of Mo(6) dioxocomplexes with Schiff bases on the basis of acylhydrazones of salicylic aldehyde, 16:34674 (IA;SU;In Russian)
Structure of polycrystalline perrhenates from $^{185,187}$Re NQR data, 16:34665 (IA;SU;In Russian)
Structure of three monooxychloride transition metal complexes with 18-crown-6, 16:34637 (IA;SU;In Russian)
Structure of [$Co(DH)_2Py_2$]center dot[$InPy_2Cl_4$] and [$Co(DfH)_2$(4-pic)$_2$]center dot[$In$(4-pic)$_2Cl_4$] and their electrical properties, 16:34664 (IA;SU;In Russian)
Structure, complexing abilities of triazole- and tetrazole-containing azomethines, 16:34630 (IA;SU;In Russian)
Study of boron complexing with hydroxyethylidenediphosphonic acid by the $^{11}$B, $^{31}$P NMR method, 16:34639 (IA;SU;In Russian)
Study of complexes formed with complexones of aminocarboxylic and aminophosphonic series by $^{13}$C and $^{31}$P NMR method with the use of paramagnetic selective relaxants, 16:34656 (IA;SU;In Russian)
Study of complexing processes during alloyage of solid electrolytes by copolymers with silver-iodine-copolymer system as example, 16:34682 (IA;SU;In Russian)
Study of different-ligand vanadium coplexes with chromophore reagents of anthraquinone series and cationic surfactants, 16:34649 (IA;SU;In Russian)
Study of formation amd properties of complexex in the system $ZrO_2$-$H_2SO_4$-$NH_4F$-$H_2O$, 16:34719 (IA;SU;In Russian)
Study of nitrogen- and sulfur-containing copolymer complexing with iodine, 16:34681 (IA;SU;In Russian)
Study of $O_2F$-radical interaction with uranium tetrafluoride and uranyl fluoride, 16:34771 (IA;SU;In Russian)
Subnanosecond scintillators based on alkali metal and alkali earth metal fluorides, 16:35344 (IA;SU;In Russian)
Synthesis and certain physico-chemical properties of lanthanum and yttrium dichlorofluorides, 16:34715 (IA;SU;In Russian)
Synthesis and crystal structure of copper and cadmium coordination compounds with isomeric 1- and 2-substituted tetrazoles, 16:34626 (IA;SU;In Russian)
Synthesis and growth of optical crystals $Na_{0.4}(Ln,Y)_{0.6}F_{2.2}$, 16:34704 (IA;SU;In Russian)
Synthesis and physicochemical properties of acid potassium hexafluorohafnate, 16:34717 (IA;SU;In Russian)
Synthesis and properties of volatile $\beta$-diketonates and imino-$\beta$-diketonates of Ca, Sr, Ba and their adducts, 16:34676 (IA;SU;In Russian)
Synthesis and structure of chelates of zinc and rare earths with 2-formylcyclohexanones, 16:34677 (IA;SU;In Russian)

Synthesis and structure of four heterometallic V, Nb and W-containing complexes - $Fe_2S_2(CO)_6$ derivatives, 16:34616 (IA;SU;In Russian)
Synthesis and study of rare earth tris-tetraethyliminodiphosphates, 16:34642 (IA;SU;In Russian)
Synthesis and study of ternary compounds $C_xF$-$HalF_n$-HF ($HalF_n$=$BrF_3$, $BrF_5$, $IF_5$), 16:34723 (IA;SU;In Russian)
Synthesis of complex fluorides showing promise as materials for ionizing radiation detectors on the basis of cross-luminescence phenomenon, 16:34702 (IA;SU;In Russian)
Synthesis of graphite interaction compounds of general formula $C_nMF$ and $(CF_x)_nMF$, 16:34727 (IA;SU;In Russian)
Synthesis of iodine heptafluoride, 16:34725 (IA;SU;In Russian)
Synthesis, properties and crystal structure of double salts on the basis of thiocyanates tris(ethylenediaminates) of some metals, 16:34663 (IA;SU;In Russian)
Synthesis, structure and properties of complexes of zinc tetrahydroborate with tetrahydroborates of organic cations, 16:34620 (IA;SU;In Russian)
The preparation technology of tungsten hexafluoride of pure reagent grade, 16:34559 (IA;SU;In Russian)
Thermal decomposition of $(NH_4)_3NbOF_6$, 16:34696 (IA;SU;In Russian)
Thermodynamics of lower fluorides of niobium and tantalum $NbF_{2.5}$, $NbF_4$, $TaF_3$, 16:34699 (IA;SU;In Russian)
Transition metal ion complexing with polyoxomolybdate $[Al(OH)_6Mo_6O_{18}]^{3-}$ according to $^{17}O$ and $^{95}Mo$ NMR, M=$Zn^{2+}$-$Mn^{2+}$, 16:34667 (IA;SU;In Russian)
Trivalent uranium complexing with crown ethers, 16:34768 (IA;SU;In Russian)
Use of ionic conductors on the basis of lanthanum fluoride for developing chemical sensors, 16:34714 (IA;SU;In Russian)
Use of xenon difluoride for oxygen extraction and determination in superconducting ceramics $YBa_2Cu_3O_{7-x}$, 16:34591 (IA;SU;In Russian)
Vanadium (5) and iron (3) complexes with Meerwein ester, their structure and analytical features, 16:34653 (IA;SU;In Russian)
Vibrational and luminescence spectra of uranyl derivatives of diacid acids with donor ligands, 16:34767 (IA;SU;In Russian)
Volume desublimation of zirconium tetrafluoride, 16:34710 (IA;SU;In Russian)
X-ray diffraction and quantum-chemical study of donor-acceptor complexes, $B_{10}H_{12}L_2$, 16:34669 (IA;SU;In Russian)
X-ray diffraction study of metal alcoholates, 16:34612 (IA;SU;In Russian)

**AN SSSR, Moscow (USSR). Otdelenie Obshchej i Tekhnicheskoj Khimii**

17. All-union Chugaev conference on complex compound chemistry. Pt. 3: Summaries of reports, 16:34579 (I;SU;In Russian)
Aluminohydride complexes of samarocene and lutetocene, 16:34634 (IA;SU;In Russian)
Ambidenticity of amides in indium (3) fluorocomplexes, 16:34632 (IA;SU;In Russian)
Complexing in iodate systems, 16:34652 (IA;SU;In Russian)
Complexing properties of amphiphilic ion exchangers modified with fatty acid anions, 16:34641 (IA;SU;In Russian)
Composition and structure of molybdenum complexes in aqueous and organic media and solid products, 16:34659 (IA;SU;In Russian)

Fundamental high-pressure reaction rate data, 16:33549 (RA;US)
Integration of advanced submodels into entrained-flow code, with evaluation and documentation, 16:33622 (RA;US)
Large particle submodels, 16:33551 (RA;US)
Secondary reaction of pyrolysis products and char burnout submodel development and evaluation, 16:33550 (RA;US)
$SO_x/NO_x$ submodel development, 16:33599 (RA;US)
$SO_x/NO_x$ submodel evaluation, 16:33600 (RA;US)

**Brookhaven National Lab., Upton, NY (United States)**
810 future plans, 16:35246 (RA;US)
A computer program for the 2-D magnetostatic problem based on integral equations for the field of the conductors and boundary elements, 16:34885 (R;US)
A search for the coherent production of axions in the milli eV range, 16:35191 (R;US)
AGS silicon gold collisions measured in the E-810 TPC, 16:35283 (RA;US)
An experiment to observe strange particle production in ion collisions at the AGS, 16:35194 (R;US)
B-Physics, 16:35195 (R;US)
Baryon spectra in the low $p_T$-region, 16:35284 (RA;US)
Biological and stability problems in fuel storage systems, 16:33669 (RA;US)
Charged particle distributions in heavy ion collisions at 14.6 GeV A/c, 16:35276 (RA;US)
Charged particle multiplicity in relativistic heavy-ion collisions, 16:35275 (RA;US)
Comparison of string models for heavy ion collisions, 16:35291 (RA;US)
Construction and results of the 50 mm short R&D dipole magnets, 16:34884 (R;US)
Criteria for the selection of radionuclides for tumor radioimmunotherapy, 16:34763 (R;US)
Dilepton production theory, 16:35297 (RA;US)
Dilepton production: Results from the Bevalac extensions to the AGS, 16:35249 (RA;US)
$E_T$ distributions, nuclear stopping, and correlations among measurements from the 4 detector systems in AGS E802, 16:35277 (RA;US)
E802 HBT results, 16:35286 (RA;US)
E802: Baryons and anti-baryons, 16:35247 (RA;US)
Economical clean carbon fuel and co-product gaseous and liquid from coal: The value of a HYDROCARB coal refinery in competing with oil and gas in the current fuel markets, 16:33547 (R;US)
Energy density, stopping and flow in ultrarelativistic heavy ion collisions, 16:35298 (RA;US)
Experimental results concerning global observables from the CERN SPS heavy ion program, 16:35245 (RA;US)
Field tests on advanced control strategies, 16:34310 (RA;US)
First observation of $\Lambda^0$, $\bar{\Lambda}^0$, $K_s{}^0$ production in relativistic heavy ion collisions at the AGS, 16:35278 (RA;US)
Formation and break-up of hadronic fireballs, 16:35293 (RA;US)
Fuel quality - An industry perspective, 16:33672 (RA;US)
Fuel sulfur content, sulfur-oxide emission and corrosion in oil heating plants, 16:33670 (RA;US)
Fuels, fuel quality, and storage, 16:33671 (RA;US)
Global observables in Si + nucleus collisions at 14.6 GeV per nucleon, 16:35274 (RA;US)
HBT measurements in relativistic heavy ion collisions, 16:35251 (RA;US)
Hydrodynamical analysis of transverse momentum distributions in ultrarelativistic heavy ion collisions, 16:35294 (RA;US)
Infrared synchrotron radiation instrumentation and applications, 16:34887 (R;US)
Kaon enhancement as an evidence for chiral restoration in hot dense nuclear matter formed in heavy-ion collisions, 16:35299 (RA;US)
Long-term durability of polyethylene for encapsulation of low-level radioactive, hazardous, and mixed wastes, 16:33735 (R;US)
Modeling of water spraying of field releases of hydrogen fluoride, 16:34988 (R;US)
New applications for low-firing-rate oil burners, 16:34311 (RA;US)
New Swiss developments in low emission oil and gas firing technology, 16:34313 (RA;US)
Numerical simulations of turbulent flow fields caused by spraying of water on large releases of hydrogen fluoride, 16:34989 (R;US)
Oil appliance venting technology, 16:34312 (RA;US)
Oil heat technology for the 21st century. An overview of the BNL/DOE combustion equipment technology program, 16:34309 (RA;US)
Overview of seismic panel activities, 16:33812 (R;US)
Particle production and spectra in E802 at BNL-AGS, 16:35193 (R;US)
Photoinduced electron-transfer induced bond-cleavage reactions of substituted amines, 16:34733 (RA;US)
Physics of the pion liquid, 16:35301 (RA;US)
Physics opportunities with PILAC, 16:35255 (R;US)
Prism reactor system design and analysis of postulated unscrammed events: Revision, 16:34115 (R;US)
Production of rare composite objects in relativistic heavy ion collisions, 16:35253 (RA;US)
Rare composite objects 2 experiments, 16:35252 (RA;US)
Rare $K^+$ decays in flight: Latest results and future plans, 16:35192 (R;US)
Recent CERN results on HBT, strangeness and $p_T$-spectra from $^{16}O,^{32}S$-nucleus collisions at 200 GeV/nucleon, 16:35248 (RA;US)
Recent results from EMU01, 16:35244 (RA;US)
Reduction of FEL gain due to wiggler errors, 16:34871 (R;US)
Research in oil burner design and emissions control, 16:33675 (RA;US)
Retrofit potential and fuel quality effects for residential oil heating systems to improve efficiency and reduce emissions, 16:33676 (RA;US)
Sandwiched heating surfaces on the example of the hot water heating boiler manufactured by Viessmann Manufacturing Company Inc., Model Vitola-Biferral, 16:34314 (RA;US)
Scaling in fragmentation of target spectators, 16:35295 (RA;US)
Secondary interactions in HIJET, 16:35292 (RA;US)
Shape of pion $p_T$-spectra, 16:35296 (RA;US)
Spectra and strangeness production, 16:35270 (RA;US)
Spectra of secondary particles from nuclear collisions at ultrarelativistic energies, 16:35300 (RA;US)
Studying extremely peripheral collisions of relativistic heavy ions, 16:35250 (RA;US)

5. All-union conference on radiation heterogeneous processes. Part 2: Summaries of reports, 16:35342 (I;SU;In Russian)
Application of radiation-heterogeneous processes to improve the efficiency of sewage treatment, 16:34754 (IA;SU;In Russian)
Arsenic recovery from waste water of arsenic production industry, 16:33823 (IA;SU;In Russian)
Copper recovery from waste water of electrolytic metallurgy by radiation-chemical method, 16:34760 (IA;SU;In Russian)
Deformability and strength properties of irradiated polyethylene with heterogeneous net of lateral bonds, 16:34553 (IA;SU;In Russian)
Diffuse reflection electron spectroscopy study of radiolysis of alumonickelmolybdenum oxide systems in accelerated electron beam, 16:34737 (IA;SU;In Russian)
Effect of $\gamma$-radiation on the structure of nitrocellulose, 16:34744 (IA;SU;In Russian)
Effect of positron irradiation on lifetime of alkali halogen crystal in electric field, 16:35343 (IA;SU;In Russian)
Effect of the radiolysis of NaA and NaY zeolites on the adsorption properties, 16:34749 (IA;SU;In Russian)
Equilibrium dynamics of radiosorption purification of soluble chemical contaminants. Peculiarities of the process proceeding in non-linear region of convex sorption isotherm, 16:34747 (IA;SU;In Russian)

Feasibility study of radiation-chemical processing of waster water from Khimprom production association, 16:34753 (IA;SU;In Russian)
Ferrite ceramics sintering under irradiation, 16:34534 (IA;SU;In Russian)
Impurity diffusion in nuclear doped silicon, 16:34453 (IA;SU;In Russian)
Influence of $\gamma$-radiation on thermal stability of disperse oxide phase in nickel, 16:34452 (IA;SU;In Russian)
Intensification of ion exchange processes under the action of external fields, 16:34684 (IA;SU;In Russian)
Investigation of endothermic catalytic reactions in the radiation field of electron accelerator, 16:34756 (IA;SU;In Russian)
Joint action of ionizing radiation and radiolytic ozone on acetone aqueous solutions, 16:34755 (IA;SU;In Russian)
Material balance of radiation-adsorption removal of chlorophos on AG-3 charcoal in the flow, 16:34746 (IA;SU;In Russian)
On phase transformation in silicon dioxide under reactor radiation, 16:34533 (IA;SU;In Russian)
Peculiar features of optical degradation of $ZrO_2$+polymethylsiloxane system under separate and combined ultraviolet and electron irradiation, 16:34555 (IA;SU;In Russian)
Photo- and heat stimulated processes in coordination compounds of metals with dimethyl sulfoxide and dimethyl formamide, 16:34685 (IA;SU;In Russian)
Photochemical transformations in heterogeneous system silver-cadmium iodide, 16:34683 (IA;SU;In Russian)
Prediction of radiation properties of polymers using increment method, 16:34743 (IA;SU;In Russian)
Preparation of high purity metals by radiolysis of inorganic azides, 16:34751 (IA;SU;In Russian)
Preparation of manganese dioxide from manganese salt solutions in the field of radiation, 16:34758 (IA;SU;In Russian)
Processes of cadmium ion radiolytic precipitation in cadmium-containing solutions of electrolytic production, 16:34739 (IA;SU;In Russian)
Purification of aluminium oxide catalysts in the process of radiation-heat treatment, 16:34748 (IA;SU;In Russian)
Radiation effects in composite materials on polymer mixture base, 16:34759 (IA;SU;In Russian)
Radiation induced copolymerization of 2-methyl-5-vinyltetrazole with N-alkylamines, 16:34740 (IA;SU;In Russian)
Radiation induced destruction of nitrocellulose in heterogeneous and homogeneous media, 16:34741 (IA;SU;In Russian)
Radiation induced polymerization of 2-methyl-5-vinyltetrazole in homogeneous and heterogeneous media, 16:34742 (IA;SU;In Russian)
Radiation protection of physical and mechanical properties of nitrocellulose films, 16:34552 (IA;SU;In Russian)
Radiation-adsorption removal of pesticides at the pilot plant for sewage processing, 16:33826 (IA;SU;In Russian)
Radiation-chemical transformations in heterogeneous systems containing elementary phosphorus, 16:34757 (IA;SU;In Russian)
Radiation-induced modification of inorganic materials with organic silicon compounds, 16:34557 (IA;SU;In Russian)
Radiation-sorption processing of phenol-containing waters. Mathematical model of the process, 16:33822 (IA;SU;In Russian)
Radiation-thermal processes in heterogeneous system brown coal-pentadecane, 16:34745 (IA;SU;In Russian)
Radiation-thermal transformations in heterogeneous system brown coal-methane, 16:34752 (IA;SU;In Russian)
Radiolysis and radiation-induced crosslinking of binding polymers of working layer of magnetic ribbons under accelerated electron irradiation, 16:34551 (IA;SU;In Russian)
Radiolysis of water adsorbed on specimens of commercial-grade silica gel, 16:34738 (IA;SU;In Russian)
Regularities and mechanism of radiation-induced atmospheric corrosion of metals, 16:34454 (IA;SU;In Russian)
Structural changes in nickel alloys during radiation heat treatments, 16:34451 (IA;SU;In Russian)
Study of oxidation processes in aqueous solutions of thiourea and thioacetamide, 16:34750 (IA;SU;In Russian)
Study of paramagnetic defects in irradiated aluminium oxides of various modifications, 16:34532 (IA;SU;In Russian)
Study of the process of radiation-adsorption disinfection of sewages, 16:33825 (IA;SU;In Russian)
Study on thermoradiation sterilization of sewages, 16:33824 (IA;SU;In Russian)
Thermography of climatically and radiation aged polymers, 16:34556 (IA;SU;In Russian)
Unadditivity under combined irradiation of zinc oxide-polymethyl siloxane system by ultraviolet radiation, protons and electrons, 16:34554 (IA;SU;In Russian)
X-ray diffraction study of structure of irradiated amorphous red phosphorus, 16:34558 (IA;SU;In Russian)

**PA Consulting Group A/S, Lyngby (Denmark)**
Centre for cooling technology, 16:34401 (I;DK;In Danish)

**Pacific Northwest Lab., Richland, WA (United States)**
1991 Yearly calibration of Pacific Northwest Laboratory's gross gamma-ray borehole geophysical logging system, 16:33809 (R;US)
An assessment of the available windy land area and wind energy potential in the contiguous United States, 16:33918 (R;US)
An integrated energy approach to providing power and propulsion for the Space Exploration Initiative, 16:34214 (R;US)
Archaeological mounds as analogs of engineered covers for waste disposal sites: Literature review and progress report, 16:33772 (R;US)
Backscatter/fundamental-parameters analysis of unweighed samples using multi-target, multi-crystal, regions of interest from WDXRF and EDXRF, 16:34597 (R;US)
Bioremediation of Hanford groundwater, 16:35083 (R;US)
Calculated production of high energy neutrons by 800 MeV protons, 16:33828 (R;US)
Characterization of the coal biosolubilization process using gel permeation chromatography and CPMAS NMR, 16:33598 (R;US)
Commander's critical information requirements and how to determine them, 16:34972 (R;US)
Dungeness crab survey for the Southwest Ocean Disposal Site off Grays Harbor, Washington, June 1990, 16:35064 (R;US)
Education in computational science: Role of the national laboratories, 16:35517 (R;US)
End-Use Load and Consumer Assessment Program: Analysis of residential refrigerator/freezer performance, 16:34342 (R;US)
Environmental issues in planning building energy technologies R&D in the United States, 16:34344 (R;US)
Laser spectroscopy as an analytical technique for process control in waste management: Final report, 16:34598 (R;US)
Microstructures and mechanical behavior of mollusk shells, 16:35106 (R;US)
Minimum detectable activities of contamination control survey equipment, 16:34946 (R;US)
Mobile Energy Laboratory energy-efficiency testing programs: Semiannual report, October 1, 1990–March 31, 1991, 16:34343 (R;US)
Nondestructive examination (NDE) reliability for inservice inspection of light water reactors: Semi-annual report, April–September 1989: Volume 11, 16:34034 (R;US)
Particle measurement and brine chemistry at the Salton Sea Deep Well, 16:33914 (R;US)
Potential for using a six-phase alternating current power supply system for in situ vitrification, 16:33773 (R;US)
Preliminary economic evaluation of the Alkox process, 16:34403 (R;US)
Properties of liquid water and carbon dioxide from constant temperature-constant temperature molecular dynamics, 16:35181 (R;US)
Review of physics methodology of ATR safety analysis, 16:34209 (R;US)
Soil washing results for mixed waste pond soils at Hanford, 16:35065 (R;US)
Soil washing: A preliminary assessment of its applicability to Hanford, 16:35063 (R;US)
Status of existing federal environmental risk-based standards applicable to Department of Energy operations, 16:33819 (R;US)
Targeting industrial waste reduction, 16:34404 (R;US)

Testing of advanced ceramic fabric heat pipe for a Stirling engine, 16:34027 (R;US)
The reactivity of cesium nickel ferrocyanide towards nitrate and nitrite salts: A status report, 16:33771 (R;US)
Vickers microindentation toughness of a sintered SiC in the median-crack regime, 16:34546 (R;US)

**Paducah Gaseous Diffusion Plant, KY (United States)**
Paducah Gaseous Diffusion Plant Environmental report for 1990: Volume 3, 16:34232 (R;US)

**Palackeho Univ., Olomouc (Czechoslovakia). Lekarska Fakulta**
Comparison of SYNELISA and RIA assays in determination of pituitary gonadotropins, 16:35102 (IA;CS)
False MS-AFP results in fetal NTD screening in pregnancy, 16:35104 (IA;CS)
The RIA of progesterone in saliva of pregnant women, 16:35103 (IA;CS)
The role of accelerated RIA diagnosis within GIFT program, 16:35101 (IA;CS;In German)

**Paris-11 Univ., 91 - Orsay (France)**
Backgrounds in the Gallex solar neutrino experiment, 16:35154 (R;FR;In French)

# Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

# Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *International Energy: Subject Thesaurus* (ETDE/PUB-2). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

*See* references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

## A

**A CODES**
Air pulsed plate liquid-liquid extractor simulation, 16:33728 (R;US)

**ABRASION**
Oil Shale quarterly report, January–June 1991, 16:33718 (R;US)

**ABSORBED DOSES**
*See* RADIATION DOSES

**ABSORPTION REFRIGERATION CYCLE**
A computer model for simulation of absorption systems in flexible and modular form, 16:34339 (R;US)

**ABSORPTION SPECTROSCOPY**
Manual of selected physico-chemical analytical methods. IV, 16:34599 (R;CS;In Czech)

**AC SYSTEMS**
Potential for using a six-phase alternating current power supply system for in situ vitrification, 16:33773 (R;US)

**ACCELERATOR FACILITIES**
*See also* TARGET CHAMBERS
Proposal of physics with exotic beams at Oak Ridge, 16:34857 (R;US)

**ACCELERATORS**
*See also* HEAVY ION ACCELERATORS
LINEAR ACCELERATORS
MESON FACTORIES
Proposed research on advanced accelerator concepts: Final report, June 1, 1988–May 31, 1991, 16:34858 (R;US)

**ACCELEROMETERS**
Accelerometer and strain gage evaluation, 16:33817 (R;US)

**ACCIDENTAL IRRADIATION**
*See* RADIATION ACCIDENTS

**ACCUMULATORS**
Reliability and life cycle costs of local traffic train battery systems, 16:34360 (R;FI;In Finnish)

**ACETATES**
Biological production of ethanol from coal, March 22, 1991–June 21, 1991, 16:33570 (R;US)
Effects of calcium magnesium acetate on the combustion of coal-water slurries: Seventh quarterly project status report, 1 March 1991–31 May 1991, 16:33633 (R;US)
Estimation of uranyl acetate volatilities in the molten salt processor under pyrolytic operating conditions, 16:34732 (R;US)

**ACETIC ACID**
Chemical coal cleaning using selective oxidation: Technical report, March 1, 1991–May 31, 1991, 16:33575 (R;US)

**ACETONE**
Joint action of ionizing radiation and radiolytic ozone on acetone aqueous solutions, 16:34755 (IA;SU;In Russian)

**ACID ELECTROLYTE FUEL CELLS**
EPRI fuel cell program, 16:34275 (RA;US)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells, 16:34300 (RA;US)
Improved electrolytes for fuel cells, Part A, 16:34302 (RA;US)
Improved electrolytes for fuel cells, Part B, 16:34303 (RA;US)
Operation of phosphoric acid fuel cells on coal gases, 16:34301 (RA;US)
Perfluorosulfonic acid polymer films in phosphoric acid fuel cells, 16:34306 (RA;US)
Phosphoric acid technology status, 16:34299 (RA;US)
Westinghouse air cooled PAFC status, accomplishments and issues, 16:34304 (RA;US)

**ACID RAIN**
Study of acid depositions and their effects on soil of Casaccia (Rome), 16:35005 (R;IT)

**ACQUISITION (DATA)**
*See* DATA ACQUISITION

**ACTINIDES**
*See also* AMERICIUM
LAWRENCIUM
NEPTUNIUM
PLUTONIUM
THORIUM
URANIUM
Accelerator technology for Los Alamos nuclear-waste-transmutation and energy-production concepts, 16:34861 (R;US)

**ACTIVATION (RADIO)**
*See* RADIOACTIVATION

**ADHESIVES**
*See also* HALTHANE
Lift-off tape and its use, 16:35476 (R;US)

**ADIPOSE TISSUE**
Population exposure to dioxins, 16:35138 (IA;DE;In German)

**ADMINISTRATION**
*See* MANAGEMENT

**ADSORBENTS**
Sorbent characterization in relation to hot gas cleanup, 16:33555 (RA;US)

**ADVANCED TEST IDAHO REACTOR**
*See* ATR REACTOR

**AEROSOLS**
*See also* RADIOACTIVE AEROSOLS
Combustion fume structure and dynamics, 16:33635 (R;US)
Inertial deposition of aerosols from channel flow, 16:34815 (RA;US)

**AFTER-HEAT REMOVAL**
Proceedings of the workshop on the cooling of advanced reactors, 16:34040 (R;JP;In Japanese)

**AGRICULTURE**
*See also* DAIRY INDUSTRY
Automatic control of grain dryers, 16:34380 (RA;LU;In English, French)
Environmentally sound irrigated agriculture in the arid west: New challenges for water resources planners and environmental scientists, 16:34400 (R;US)
Processes for identifying regional influences of and responses to increasing atmospheric $CO_2$ and climate change: The MINK project: Report 6, Consequences of climate change for the MINK economy: Impacts and responses, 16:35000 (R;US)

Processes for identifying regional influences of and responses to increasing atmospheric $CO_2$ and climate change – the MINK Project: Report 2A, Agricultural production and resource use in the MINK Region without and with climate change, 16:34998 (R;US)
Processes for identifying regional influences of and responses to increasing atmospheric $CO_2$ and climate change: The MINK project: Report 6, Consequences of climate change for the MINK economy: Impacts and responses, 16:35000 (R;US)
The application of moisture measurement at microwave frequency for high-capacity dryers, 16:34385 (RA;LU;In English, French)

**AIR CONDITIONING**
Supervisory control of variable air volume air conditioning system, 16:34349 (R;FI;In Finnish)

**AIR FLOW**
Air movement, comfort and ventilation in workstations, 16:34335 (R;US)
Air-injection field tests to determine the effect of a heat cycle on the permeability of welded tuff, 16:33789 (R;US)
Three-dimensional simulations of airflow through an electrically heated screen using the spectral-element code NEKTON, 16:34831 (R;US)

**AIR POLLUTION**
*See also* INDOOR AIR POLLUTION
Investigations of the wet and dry deposition of air pollutants into forest stands of the Black Forest and Schoenbuch. Final report, 16:35006 (I;DE;In German)
Nuisances from gaseous air pollutants at the Bergstrasse. Measuring report, 16:35007 (I;DE;In German)
Risk assessment - a research program aimed at health risks from air pollution in the general environment, 16:35493 (R;SE;In Swedish)
Sources and distribution of $NO_x$ in the upper troposphere at northern midlatitudes, 16:35012 (R;DE)
Statistical analysis of the Saarland region - air pollution and lung cancer, 16:35140 (IA;DE;In German)

**AIR QUALITY**
Environmental monitoring for the DOE coolside and LIMB demonstration extension projects: Final report, August–October 1990, 16:33977 (R;US)

**AIR SAMPLERS**
Equipment for coal dust sampling, 16:33643 (RA;US)

**AIRBORNE PARTICLES**
*See* PARTICULATES

**AIRBORNE PARTICULATES**
*See* PARTICULATES

**AIRCRAFT**
*See also* HELICOPTERS
Observation of laminar boundary layer transition on light monoplane, 16:34354 (R;JP;In Japanese)
Soot in the stratosphere: The impact of current and HSCT aircraft emissions, 16:35015 (R;US)

**AIRFOILS**
Investigation of a two-dimensional hybrid laminar flow control airfoil at high subsonic flow. Part 1.: Aerodynamic characteristics of a basic airfoil NLAM78, 16:34353 (R;JP;In Japanese)
Velocity measurements inside the leading edge vortex formed on a delta wing, 16:34356 (R;JP;In Japanese)

**ALARA**
ALARA at nuclear power plants, 16:34127 (RA;US)
ALARA for the practical person, 16:35329 (RA;US)
New influences on the ALARA concept, 16:35330 (RA;US)
The alara center and its information service–ACE, 16:34116 (R;US)

**ALASKA**
Terrestrial gas hydrate occurrences, 16:33692 (RA;US)

**ALCOHOLS**
*See also* BUTANOLS
ETHANOL
GLYCEROL
METHANOL
PROPANOLS
Alkali/$TX_2$ catalysts for $CO/H_2$ conversion to $C_1$–$C_4$ alcohols: Technical progress report, March–May 1991, 16:33563 (R;US)
Photoinduced electron-transfer induced bond-cleavage reactions of substituted amines, 16:34733 (RA;US)
Preliminary economic evaluation of the Alkox process, 16:34403 (R;US)
Probe molecule studies: Active species in alcohol synthesis: Third quarterly report, April 1991–June 1991, 16:33580 (R;US)
Suprabiotic catalyst systems for selective oxidation of light alkane gases to fuel oxygenates, 16:33711 (RA;US)

**ALFVEN WAVES**
Continuum damping of high mode number toroidal Alfven waves, 16:35391 (R;US)

**ALGEBRAIC FIELD THEORY**
Dirac versus Wigner: Towards a universal particle concept in local quantum field theory, 16:35240 (R;DE)

**ALGERIA**
The wind energy experience of H.C.R. in water pumping and electricity production, 16:33958 (RA;DK)

**ALKALI METAL COMPOUNDS**
*See also* CESIUM COMPOUNDS
Anion-exchange resin-based desulfurization process: Quarterly technical progress report, April 1, 1991–June 30, 1991, 16:33979 (R;US)
Investigation of uranyl selenate complexes with fluorides of some alkali metals and ammonium, 16:34772 (IA;SU;In Russian)
Synthesis of complex fluorides showing promise as materials for ionizing radiation detectors on the basis of cross-luminescence phenomenon, 16:34702 (IA;SU;In Russian)

**ALKANES**
*See also* ETHANE
METHANE
Advanced phase change materials and systems for solar passive heating and cooling of residential buildings: Final technical report, May 29, 1986–July 15, 1988, 16:33866 (R;US)
Diffraction by macromolecular fluids, 16:34575 (R;US)
Preliminary economic evaluation of the Alkox process, 16:34403 (R;US)
Radiation-thermal processes in heterogeneous system brown coal-pentadecane, 16:34745 (IA;SU;In Russian)

**ALKYLATES**

UDIMET 700
Aluminum arc welding method, 16:34515 (R;US)
Conference on fossil energy materials abstracts, 16:33973 (R;US)
Creep in $L1_2$-intermetallics, 16:34434 (R;US)
Moisture-induced environmental embrittlement of ordered intermetallic alloys at ambient temperatures, 16:34433 (R;US)
On the formation of a joint during cold welding, 16:34520 (R;US)
Primary fabrication processes for nickel and iron aluminides, 16:34436 (R;US)
The effect of casting temperature on the fatigue properties of cast nickel aluminide alloys, 16:34435 (R;US)
Theory of ordering transformations in metals and minerals, 16:34508 (R;US)
**ALUMINIUM BASE ALLOYS**
Development of microstructures with improved cryogenic toughness through local variations in stress state: Aluminum-lithium alloys, 16:34506 (R;US)
Influence of extrinsic crack deflection and delamination mechanisms on the cryogenic toughness of aluminum-lithium alloy 2090: Behavior in plate (T81) vs sheet (T83) material, 16:34504 (R;US)
Microstructural influence on the work hardening of aluminum-lithium alloy 2090 at cryogenic temperatures, 16:34510 (R;US)
On the micromechanisms of fatigue-crack propagation in aluminum- lithium alloys: Sheet vs. plate material, 16:34505 (R;US)
Synthesis of $Al/Al_3Ti$ two-phase alloys by mechanical alloying, 16:34503 (R;US)
**ALUMINIUM COMPOUNDS**
*See also* ALUMINATES
ALUMINIUM FLUORIDES
ALUMINIUM OXIDES
Strained quantum well InGaSb/AlGaSb heterostructures grown by molecular beam epitaxy, 16:34572 (R;US)

**ALUMINIUM FLUORIDES**
Manufacture, optical and electrical properties of $CdF_2$-$AlF_3$-$CdGeO_3$ system glasses, 16:34561 (IA;SU;In Russian)
**ALUMINIUM OXIDES**
Alternative formulations of regenerable flue gas cleanup catalysts: Progress report, March 1, 1991–May 31, 1991, 16:33978 (R;US)
Anisotropic dislocation loop nucleation in ion-irradiated $MgAl_2O_4$, 16:35433 (R;US)
Diffuse reflection electron spectroscopy study of radiolysis of alumonickelmolybdenum oxide systems in accelerated electron beam, 16:34737 (IA;SU;In Russian)
Experimental investigation of the influence of crack fields on mechanical and fracture-mechanical quantities. Final report, 16:34531 (R;DE;In German)
Interfacial fracture toughness of alumina/niobium systems, 16:34566 (R;US)
Purification of aluminium oxide catalysts in the process of radiation-heat treatment, 16:34748 (IA;SU;In Russian)
Spectrographic determination of impurities in ceramic materials for nuclear fusion reactors. 1. Analysis of alumina, 16:34582 (R;ES;In Spanish)
Study of paramagnetic defects in irradiated aluminium oxides of various modifications, 16:34532 (IA;SU;In Russian)
**ALUMINUM**
*See* ALUMINIUM
**ALVEOLI (PULMONARY)**
*See* LUNGS
**AMENDMENTS**
Dealing with duplicate regulations and conflicting jurisdictions, 16:34251 (R;US)
**AMERICIUM**
Temporal distribution of Pu and Am in the marine environment of southern coast of Spain, 16:35071 (R;ES)
**AMERICIUM COMPLEXES**
Some data on hydroxide compounds of pentavalent neptunium and americium, 16:34770 (IA;SU;In Russian)
**AMIDES**
Study of oxidation processes in aqueous solutions of thiourea and thioacetamide, 16:34750 (IA;SU;In Russian)
**AMINES**
Photoinduced electron-transfer induced bond-cleavage reactions of substituted amines, 16:34733 (RA;US)
[Transition metal mediated transformations of small molecules]: Annual progress report, December 1, 1990–November 30, 1991, 16:34604 (R;US)
**AMINO ALCOHOLS**

STANDARDS
**AUTOMOBILES**
Light-duty vehicle summary: First six months of Model Year 1991, 16:34358 (R;US)
Study of thermoelectric technology for automobile air conditioning, 16:34352 (R;US)
**AVR REACTOR**
Measurement of neutron flux in the AVR, 16:34051 (R;DE)
**AXIONS**
A search for the coherent production of axions in the milli eV range, 16:35191 (R;US)
**AZIDES**
Preparation of high purity metals by radiolysis of inorganic azides, 16:34751 (IA;SU;In Russian)

# B

**B CODES**
Measured energy savings and economics of retrofitting existing single- family homes: An update of the BECA-B database: Volume 2, 16:34326 (R;US)

**B MESONS**
A measurement of $\tau(B^+)/\tau(B^0)$ from the lepton and dilepton rates in $\Upsilon(4S)$ decays, 16:35198 (R;DE)
B-Physics, 16:35195 (R;US)
B-jet tagging using electrons at SDC, 16:35188 (R;US)
Measurement of $B^0\bar{B}^0$ mixing at CDF, 16:35205 (R;US)
On semileptonic B decays into longitudinally polarized $\rho$ mesons, 16:35224 (R;DE)
T,b, and new particle searches at $p\bar{p}$ colliders, 16:35206 (R;US)

**BACILLUS**
Microbial enhanced oil recovery and wettability research program: Annual report, FY 1990, 16:33658 (R;US)
Microbial enhancement of oil production from carbonate reservoirs: Quarterly report, January–March 1991, 16:33657 (R;US)
Surfactant based enhanced oil recovery mediated by naturally occurring microorganisms, 16:33660 (R;US)

**BACKGROUND RADIATION**
An aerial radiological survey of the area surrounding the Dresden Nuclear Power Plant, Morris, Illinois: Date of survey: September 1972, 16:35048 (R;US)
Radiological survey of the McGuire Bomarc Site, New Jersey: Date of survey: November 1973, 16:35044 (R;US)
Radiological survey of the area surrounding the Brown's Ferry Nuclear Power Plant, Decatur, Alabama: Date of survey: 25 and 26 May 1973, 16:35046 (R;US)
Radiological survey of the area surrounding the H. B. Robinson S. E. Plant, Hartsville, South Carolina: Date of survey: 19–21 May 1973, 16:35045 (R;US)
Radiological survey of the area surrounding the Nuclear Reactor Testing Station, Idaho Falls, Idaho: Date of survey: 1 and 2 February 1972, 16:35042 (R;US)
Radiological survey of the area surrounding the Project GNOME Test Site, Carlsbad, New Mexico: Date of survey: 13 May 1972, 16:35037 (R;US)
Radiological survey of the area surrounding the Shippingport Atomic Power Station Shippingport, Pennsylvania: Date of survey: 24 February 1973, 16:35040 (R;US)

**BACKSCATTERING**
Backscatter/fundamental-parameters analysis of unweighed samples using multi-target, multi-crystal, regions of interest from WDXRF and EDXRF, 16:34597 (R;US)

**BACTERIA**
*See also* BACILLUS
CLOSTRIDIUM
Development of a vaccine for bacterial kidney disease in salmon: Final report, 16:33852 (R;US)
Development of luminescent bacteria as tracers for geological reservoir characterization: Quarterly report, January–March 1991, 16:33649 (R;US)

**BAGASSE**
Effect of the steam explosion pretreatment on enzymatic hydrolysis of eucaliptus wood and sweet sorghum bagasse, 16:33835 (R;ES;In Spanish)

**BANKS**
*See* COMMERCIAL BUILDINGS

**BARIUM COMPOUNDS**
*See also* BARIUM OXIDES
Effects of ambient background gases on YBCO plume propagation under film growth conditions: Spectroscopic, ion probe, and fast photographic studies, 16:34437 (R;US)

**BARIUM OXIDES**
Chemical thermodynamic equilibria and conductivity of nonstoichiometric $YBa_2Cu_3O_{7-\delta}$: A review, 16:34524 (R;US)
Energetics and statistics of order in alloys with application to oxide superconductors, 16:34543 (R;US)
Laser ablation synthesis and properties of epitaxial $YBa_2Cu_3O_{7-\delta}/PrBa_2Cu_3O_{7-\delta}$ superconducting superlattices, 16:34528 (R;US)
Magnetization studies of irradiation modified single crystal $Y_1Ba_2Cu_3O_7$ superconductors: Flux creep and annealing effects, 16:34526 (R;US)
Non-stoichiometric defects in YBaCuO thin films, 16:34541 (R;US)
Properties of epitaxial $YBa_2Cu_3O_{7-\delta}$-based superconducting superlattices, 16:34527 (R;US)
Theoretical modeling and experimental characterization of planar defects in $Y_2Ba_4Cu_{6+x}O_{14+x}$, 16:34540 (R;US)

**BARK**
Eucalyptus globulus debarking plant: Demonstration project: Final report, 16:33837 (R;LU)

**BARLEY**
Nuclear genes encoding plastid proteins expressed early in chloroplast development: Progress report, 16:35092 (R;US)

**BARYON NUMBER**
The riddle of high-energy baryon number violation, 16:35233 (R;US)

**BARYON RESONANCES**

**Chemical Analysis**
Coal liquefaction process streams characterization and evaluation: Quarterly Technical progress report, July 1–September 30, 1990, 16:33571 (R;US)
**Chemical Composition**
Task 3 - Advanced techniques for coal and mineral characterization, 16:33595 (RA;US)
**Combustion Kinetics**
Secondary reaction of pyrolysis products and char burnout submodel development and evaluation, 16:33550 (RA;US)
Task 5 - Fundamental studies of mineral matter vaporization and residual ash formation, 16:33639 (RA;US)
Task 6 - Behavior and effects of coal mineral matter in laboratory pulverized coal combustor, 16:33640 (RA;US)
Task 7 and 8 - Idealized combustor studies and alkali kinetics modeling, 16:33641 (RA;US)
**Desulfurization**
Chemical coal cleaning using selective oxidation: Technical report, March 1, 1991–May 31, 1991, 16:33575 (R;US)
**Devolatilization**
Kinetics of coal pyrolysis and devolatilization: Technical progress report, February 1, 1986–April 30, 1986, 16:33625 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, May 1, 1987–July 31, 1987, 16:33627 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, November 1, 1987–January 31, 1988, 16:33629 (R;US)
**Heating**
Investigation of the rank dependence of tar evolution: Quarterly report, January 1, 1991–March 31, 1991, 16:33564 (R;US)
**Mineralogy**
Task 3 - Advanced techniques for coal and mineral characterization, 16:33595 (RA;US)
**Oxidation**
Chemical coal cleaning using selective oxidation: Technical report, March 1, 1991–May 31, 1991, 16:33575 (R;US)
**Petrography**
Coal liquefaction process streams characterization and evaluation: Quarterly Technical progress report, July 1–September 30, 1990, 16:33571 (R;US)
**Plasticity**
Coal plasticity at high heating rates and temperatures: Fifth technical progress report, 16:33566 (R;US)

Coal plasticity at high heating rates and temperatures: Sixth technical progress report, 16:33567 (R;US)

**Pyrolysis**

Large particle submodels, 16:33551 (RA;US)

Secondary reaction of pyrolysis products and char burnout submodel development and evaluation, 16:33550 (RA;US)

**Structural Chemical Analysis**

Characterization of the coal biosolubilization process using gel permeation chromatography and CPMAS NMR, 16:33598 (R;US)

Spin-mapping of coal structures with ESE and ENDOR: Tenth quarterly report, 16:33592 (R;US)

**Supercritical Gas Extraction**

Kinetics of supercritical fluid extraction of bituminous coal with tert-butanol: [Technical progress report, May–July 1991], 16:33576 (R;US)

**BLACK LIQUIDS**

Fundamental studies of black liquor combustion: Report No. 4, Phases, 2, 3, and 4: Final report, December 1987–December 1989, 16:34369 (R;US)

**BLACK SHALES**

Drilling and completion of a horizontal Devonian shale well: Martin County, Kentucky, 16:33703 (RA;US)

Geotechnical evaluations for siting horizontal wells in Devonian shale reservoirs, 16:33714 (RA;US)

Horizontal wells in the Devonian shale, 16:33702 (RA;US)

**BLANKETS (BREEDING)**

*See* BREEDING BLANKETS

**BLOWOUT PREVENTERS**

16:33662 (PA;CA)

**BOILERS**

Evaluation of gas-reburning and low $NO_x$ burners on a wall fired boiler: Technical progress report No. 3, April 1, 1991–June 30, 1991, 16:33970 (R;US)

Predictive modelling of boiler fouling: Quarterly technical progress report, April 1, 1991–June 30, 1991, 16:33969 (R;US)

Predictive modelling of boiler fouling: Quarterly technical progress report, January 1, 1991–March 31, 1991, 16:33968 (R;US)

Sandwiched heating surfaces on the example of the hot water heating boiler manufactured by Viessmann Manufacturing Company Inc., Model Vitola-Biferral, 16:34314 (RA;US)

The Titan Lomas boiler: A new approach, 16:34315 (RA;US)

**Bioconversion**
Oxygen transfer problems in coal processing bioreactors, 16:33584 (R;US)
Report to Congress: Coal refineries: A definition and example concepts, 16:33548 (R;US)

**Chemical Analysis**
Introduction and overview of program tasks, 16:33636 (RA;US)

**Chemical Bonds**
Catalysis and co-catalysis of bond cleavages in coal and coal analogs: Quarterly report, May 1–July 31, 1991, 16:33594 (R;US)
The dual role of oxygen functions in coal pretreatment and liquefaction: Crosslinking and cleavage reactions: First quarterly report, April 2, 1991–June 30, 1991, 16:33583 (R;US)

**Chemical Composition**
Methane formation and retention in coal: Quarterly technical progress report, April 1, 1991–June 30, 1991, 16:33593 (R;US)

**Cleaning**
Coal liquefaction process streams characterization and evaluation: Quarterly Technical progress report, July 1–September 30, 1990, 16:33571 (R;US)
Development of the chemical and electrochemical coal cleaning process: Thirteenth quarter technical progress report, April 1, 1991–June 30, 1991, 16:33541 (R;US)

**Coal Liquefaction**
Fine particle clay catalysts for coal liquefaction: Quarterly technical report, February 8, 1991–May 8, 1991, 16:33574 (R;US)

**Combustion**
Advanced atomization concept for CWF burning in small combustors, Phase 2: Quarterly technical progress report No. 2, January 1, 1991–March 31, 1991, 16:33634 (R;US)
Combustion fume structure and dynamics, 16:33635 (R;US)
Development of a vortex combustor (VC) for space/water heating applications (cold flow modeling): Final report, 16:33630 (R;US)
Effects of calcium magnesium acetate on the combustion of coal-water slurries: Seventh quarterly project status report, 1 March 1991–31 May 1991, 16:33633 (R;US)
$N_2O$ formation from advanced $NO_x$ control processes (selective non-catalytic reduction and coal reburning): Final report, 16:33601 (R;US)

**Combustion Kinetics**
Ash physics and chemistry submodel, 16:33621 (RA;US)
Fundamental high-pressure reaction rate data, 16:33549 (RA;US)
Integration of advanced submodels into entrained-flow code, with evaluation and documentation, 16:33622 (RA;US)
Introduction and overview of program tasks, 16:33636 (RA;US)
$SO_x/NO_x$ submodel development, 16:33599 (RA;US)
Task 4 - Fundamental studies of selected ash vaporization, nucleation, condensation, and coagulation phenomena, 16:33637 (RA;US)

**Compiled Data**
Historical monthly energy review, 1973–1988, 16:34252 (R;US)

Monthly energy review, September 1991 (Contains glossary.), 16:34253 (R;US)
Trends in contract coal transportation, 1979–1987, 16:33614 (R;US)

**Conversion**
Economical clean carbon fuel and co-product gaseous and liquid from coal: The value of a HYDROCARB coal refinery in competing with oil and gas in the current fuel markets, 16:33547 (R;US)
Report to Congress: Coal refineries: A definition and example concepts, 16:33548 (R;US)

**Desulfurization**
Process development for production of coal/sorbent agglomerates: Technical report, March 1, 1991–May 31, 1991, 16:33544 (R;US)
Surface electrochemical control for fine coal and pyrite separation: Technical progress report, April 1, 1991–June 30, 1991, 16:33542 (R;US)

**Devolatilization**
Kinetics of coal pyrolysis and devolatilization: Technical progress report, August 1, 1987–October 31, 1987, 16:33628 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, January 1, 1987–March 31, 1987, 16:33557 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, November 1, 1985–January 31, 1986, 16:33624 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, October 1, 1986–December 31, 1986, 16:33626 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, September 28, 1984–April 30, 1985, 16:33623 (R;US)

**Extrusion**
Coal-log pipeline system development: Quarterly report No. 4, May 25, 1991–August 24, 1991, 16:33613 (R;US)

**Flotation**
Surface electrochemical control for fine coal and pyrite separation: Technical progress report, April 1, 1991–June 30, 1991, 16:33542 (R;US)

**Fluidized-Bed Combustion**
Comprehensive report to Congress Clean Coal Technology Program: Pressurized Circulating Fluidized Bed Demonstration Project, 16:33966 (R;US)
Identification of barriers to the use of atmospheric fluidized bed combustion in Kentucky, 16:33620 (R;US)

**Hydraulic Transport**
Coal-log pipeline system development: Quarterly report No. 4, May 25, 1991–August 24, 1991, 16:33613 (R;US)

**Ignition**
Experimental studies on group ignition of a cloud of coal particles: Quarterly progress report No. 11, February 16, 1991–May 15, 1991, 16:33632 (R;US)

**Information**
Sulfur and ash reduction potential and selected chemical and physical properties of United States coals: Executive summary, 16:33596 (R;US)

**Infrared Spectra**
Characterization of the Argonne premium coals by using NMR of hydrogen and carbon-13 and FTIR spectroscopy, 16:33597 (R;US)

**Molecular Structure**
Cooperative research program in coal liquefaction: Quarterly report, November 1, 1990–January 31, 1991, 16:33573 (R;US)
Spin-mapping of coal structures with ESE and ENDOR: Ninth quarterly report, 16:33591 (R;US)

**Nmr Spectra**
Characterization of the Argonne premium coals by using NMR of hydrogen and carbon-13 and FTIR spectroscopy, 16:33597 (R;US)

**Pyrolysis**
Coal to char chemistry submodel development and evaluation, 16:33590 (RA;US)
Fundamental high-pressure reaction rate data, 16:33549 (RA;US)
Interim report on conversion of coal to liquids via catalytic hydropyrolysis, 16:33586 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, January 1, 1987–March 31, 1987, 16:33557 (R;US)

**Research Programs**
Identification of barriers to the use of atmospheric fluidized bed combustion in Kentucky, 16:33620 (R;US)

**Solids Flow**
Dense inclined flows: Theory and experiments: Quarterly technical progress report, April 1, 1991–June 30, 1991, 16:33615 (R;US)

**Sulfur Content**
Baseline performance evaluation of micronized-magnetite cycloning, 16:33545 (R;US)

**Supercritical Gas Extraction**
Supercritical fluid thermodynamics for coal processing: Quarterly progress report, April 1, 1991–June 30, 1991, 16:33562 (R;US)

**Supply and Demand**
US energy flow, 1990, 16:34270 (R;US)

**Surface Properties**
Undergraduate research studies program at participating institutions of the HBCU Fossil Energy Consortium: Quarterly report on the Atlanta University Center, Inc. Component, April 1, 1990–June 30, 1990, 16:33569 (R;US)

**Transport**
Trends in contract coal transportation, 1979–1987, 16:33614 (R;US)

**Volatile Matter**
Monomers in coal macromolecules, 16:33589 (R;US)

**Washing**
Sulfur and ash reduction potential and selected chemical and physical properties of United States coals: Executive summary, 16:33596 (R;US)

**COAL FUEL CELLS**
Development of a coal-fueled internal manifold heat exchanger (IMHEX) molten carbonate fuel cell stack, 16:34294 (RA;US)
Effect of coal-derived trace species on the performance of molten carbonate fuel cells, 16:34297 (RA;US)
Improved anode catalysts for coal gas-fueled phosphoric acid fuel cells, 16:34300 (RA;US)
MCFC systems, coal-gas based, 16:34291 (RA;US)
METC in-house gasification research, 16:33967 (RA;US)
Operation of phosphoric acid fuel cells on coal gases, 16:34301 (RA;US)

**COAL GAS**
Pore structure and reactivity changes in hot coal gas desulfurization sorbents: Technical progress report, October–December 1990, 16:33559 (R;US)

**COAL GASIFICATION**
*See also* WELLMAN-GALUSHA PROCESS
Application of fixed-bed code, 16:33553 (RA;US)
Ash physics and chemistry submodel, 16:33621 (RA;US)

**GADOLINIUM COMPLEXES**
Investigation of triplet state of Gd(3) complexes with 1,10-phenanthroline by MROD method, 16:34672 (IA;SU;In Russian)

**GAGES (STRAIN)**
*See* STRAIN GAGES

**GALLIUM**
Cooperative research program in coal liquefaction: Quarterly report, May 1, 1990–July 31, 1990, 16:33572 (R;US)
Cooperative research program in coal liquefaction: Quarterly report, November 1, 1990–January 31, 1991, 16:33573 (R;US)

**GALLIUM 66**
Nuclear Medicine Program progress report for quarter ending June 30, 1991, 16:34775 (R;US)

**GALLIUM 67**
Minimizing exposure in nuclear medicine through optimum use of shielding devices, 16:35112 (RA;US)

**GALLIUM ANTIMONIDES**
Strained quantum well InGaSb/AlGaSb heterostructures grown by molecular beam epitaxy, 16:34572 (R;US)

**GALLIUM ARSENIDES**
Microscopic determination of stress distribution in GaAs grown at low temperature on GaAs (100), 16:34567 (R;US)
Tests on photoconductive semiconductor switches for subnanosecond risetime, multimegavolt pulser applications, 16:34849 (R;US)

**GAMMA DETECTION**
Gamma-Ray interaction probabilities for some liquid scintillators, 16:34924 (R;ES;In Spanish)
Putting in action the $4\pi$ $\gamma$ multidetector TAPS at Ganil, 16:34939 (R;FR;In French)

**GAMMA RADIATION**
*See also* PROMPT GAMMA RADIATION
Estimate of gamma dose rates from 1000 MWD/T and 2000 MWD/T plutonium, 16:33807 (R;US)
GAMUT: A computer code for $\gamma$-ray energy and intensity analysis, 16:35265 (R;US)
New methods for toxicokinetic studies on chemicals carcinogens by means of analysis of DNA damage, 16:35135 (IA;DE;In German)
Radiological survey of the area surrounding the Shippingport Atomic Power Station Shippingport, Pennsylvania: Date of survey: 24 February 1973, 16:35040 (R;US)
Selected HENRE measurements, 16:35314 (R;US)
Snow gaging by airborne radiological surveys, status through September 1972, 16:35036 (R;US)
Snow water equivalent survey in the New York–Lake Ontario region: Dates of survey: February 26–March 1, 1977, 16:35051 (R;US)

**GAMMA REACTIONS**
*See* PHOTONUCLEAR REACTIONS

**GAMMA SOURCES**
Aerial Radiological Measuring Surveys (ARMS): Dresden, September 1968, 16:35034 (R;US)
HAVE SINEW-1 recovery operation, August 1971, 16:35041 (R;US)

**GAMMA SPECTRA**
**Aerial Surveying**
Aerial radiological surveys of the areas surrounding the Diablo Canyon, San Onofre, and Trojan Nuclear Power Plants, Diablo Canyon and San Clemente, California, and Prescott, Oregon: Dates of surveys: July 1975 and April 1976, 16:35004 (R;US)
An aerial radiological survey of Argonne Site A, Palos Hills, Illinois: Date of survey: May 1976, 16:35052 (R;US)
Radiological survey of the area surrounding the Calvert Cliffs Nuclear Power Plant, Lusby, Maryland: Date of survey: 8 and 9 June 1973, 16:35047 (R;US)
Radiological survey of the area surrounding the Haddam Neck Plant, Haddam Neck, Connecticut: Date of survey: 27, 28 August 1969, 16:35043 (R;US)

**Air Samplers**
NATS support summary Schooner event, Nevada Test Site, 16:35003 (R;US)

**Comparative Evaluations**
Aerial radiological survey of the D.C. Cook Nuclear Plant (Bridgman, Michigan): Date of survey: September 1975, 16:35049 (R;US)

**Radiometric Surveys**
ARMS (Aerial Radiological Measuring Surveys): Humboldt Bay environmental radiation survey, October–November 1967, 16:35033 (R;US)
Aerial Radiological Measuring Surveys (ARMS): Big Rock Point, August 1968 (Appendix contains gamma-ray spectral charts), 16:35035 (R;US)
Aerial Radiological Measuring Surveys (ARMS): Dresden, September 1968, 16:35034 (R;US)
Aerial radiological survey of the D.C. Cook Nuclear Plant (Bridgman, Michigan): Date of survey: September 1975, 16:35049 (R;US)
An aerial radiological survey of the area surrounding the Dresden Nuclear Power Plant, Morris, Illinois: Date of survey: September 1972, 16:35048 (R;US)
An aerial radiological survey of the area surrounding the Palisades Plant Nuclear Reactor Site (South Haven, Michigan): Date of survey: June 1976, 16:35050 (R;US)
HAVE SINEW-1 recovery operation, August 1971, 16:35041 (R;US)
Radiological survey of the McGuire Bomarc Site, New Jersey: Date of survey: November 1973, 16:35044 (R;US)
Radiological survey of the area surrounding the Brown's Ferry Nuclear Power Plant, Decatur, Alabama: Date of survey: 25 and 26 May 1973, 16:35046 (R;US)
Radiological survey of the area surrounding the Enrico Fermi Atomic Power Plant, Monroe, Michigan: Date of survey: 1 September 1970, 16:35039 (R;US)
Radiological survey of the area surrounding the H. B. Robinson S. E. Plant, Hartsville, South Carolina: Date of survey: 19–21 May 1973, 16:35045 (R;US)
Radiological survey of the area surrounding the Monticello Nuclear Generating Plant, Monticello, Minnesota: Date of survey: 21, 22 August 1970, 16:35038 (R;US)
Radiological survey of the area surrounding the Nuclear Reactor Testing Station, Idaho Falls, Idaho: Date of survey: 1 and 2 February 1972, 16:35042 (R;US)
Radiological survey of the area surrounding the Project GNOME Test Site, Carlsbad, New Mexico: Date of survey: 13 May 1972, 16:35037 (R;US)
Radiological survey of the area surrounding the Shippingport Atomic Power Station Shippingport, Pennsylvania: Date of survey: 24 February 1973, 16:35040 (R;US)
Snow gaging by airborne radiological surveys, status through September 1972, 16:35036 (R;US)
Snow water equivalent survey in the New York–Lake Ontario region: Dates of survey: February 26–March 1, 1977, 16:35051 (R;US)

**Remote Sensing**
Aerial radiological surveys of the areas surrounding the Diablo Canyon, San Onofre, and Trojan Nuclear Power Plants, Diablo Canyon and San Clemente, California, and Prescott, Oregon: Dates of surveys: July 1975 and April 1976, 16:35004 (R;US)

**GAMMA SPECTROMETERS**
The GAMMASPHERE, 16:34929 (R;US)

**GARDENING**
Soil heating in connection with outdoor garden production, 16:33915 (R;FI;In Finnish)

**GAS BURNERS**
New Swiss developments in low emission oil and gas firing technology, 16:34313 (RA;US)

**GAS CONDENSATES**
The effect of the number of pseudocomponents used in simulating gas condensate recycling in heterogeneous reservoirs, 16:33698 (R;DK)

**GAS COOLANTS**
*See* GASES

**GAS CYLINDERS**
Cracked lifting lug welds on ten-ton $UF_6$ cylinders, 16:33732 (R;US)
Temporary patching of damaged $UF_6$ cylinders, 16:33733 (R;US)

**GAS ENGINES**
*See* INTERNAL COMBUSTION ENGINES

**GAS FIELDS**

KW reactor incident—Investigation record: Testimony transcript [of] R. R. Meyers interview, January 24, 1955, 16:34195 (R;US)
Preliminary report of front nozzle failure tube 1162 KE, 16:34199 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 18: Internal tube cutting, 16:34154 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 22: Graphite boring over process tube: Phase 1, 16:34158 (R;US)
Tube No. 3560 KW removal equipment description, 16:34135 (R;US)

**Reactor Components**
Hazards Summary Report: Volume 3, Description of the 100-KE and the 100-KW production reactor plants, 16:34057 (R;US)

**Reactor Control Systems**
Hazards Summary Report: Volume 2, Process control and technical data, Hanford K Production Reactors, 16:34045 (R;US)

**Reactor Cooling Systems**
Operational interruption, B Reactor, September 12, 1959, 16:34104 (R;US)

**Reactor Fueling**
Slightly enriched uranium-thoria loading Hanford K production reactors: Hazards summary report, Supplement 1, 16:34198 (R;US)

**Reactor Operation**
AEC research and development report: Atomic weapon data: Technical progress letter for October 1950, 16:34097 (R;US)
Douglas United Nuclear, Inc. monthly report, February 1966, 16:34133 (R;US)

Examination of slugs from ruptured front pigtail incident at C-Pile, 16:34102 (R;US)
Hanford Engineer Works monthly report, July 1947, 16:34067 (R;US)
Hanford Engineer Works monthly report, June 1947, 16:34066 (R;US)
Hanford Engineer Works technical progress letter No. 164, August 17–August 23, 1947, 16:34068 (R;US)
Hanford Engineering Works monthly report, April 1947, 16:34071 (R;US)
Hanford Engineering Works monthly report, August, 1947, 16:34069 (R;US)
Hanford Laboratories monthly activities report, February, 1963, 16:34110 (R;US)
Hanford Works monthly report, August 1949, 16:34089 (R;US)
Hanford Works monthly report, December 1947, 16:34075 (R;US)
Hanford Works monthly report, February 1948, 16:34056 (R;US)
Hanford Works monthly report, February 1950, 16:34095 (R;US)
Hanford Works monthly report, July 1949, 16:34087 (R;US)
Hanford Works monthly report, June 1949, 16:34086 (R;US)
Hanford Works monthly report, March 1948, 16:34077 (R;US)
Hanford Works monthly report, May, 1948, 16:34080 (R;US)
Hanford Works monthly report, November 1947, 16:34074 (R;US)
Hanford Works monthly report, November 1949, 16:34093 (R;US)
Hanford Works monthly report, October 1947, 16:34073 (R;US)
Hanford Works monthly report, October 1949, 16:34091 (R;US)
Hanford Works monthly report, September 1947, 16:34072 (R;US)
Hanford Works monthly report, September 1949, 16:34090 (R;US)
Hanford Works technical progress letter No. 193, March 7–March 13, 1948, 16:34076 (R;US)
Hanford Works technical progress letter No. 200, April 25–May 1, [1948], 16:34078 (R;US)
Hanford Works technical progress letter No. 203, May 16–May 22, [1948], 16:34079 (R;US)
Hanford Works technical progress letter No. 213, July 25, 1948–July 31, 1948, 16:34082 (R;US)
Hanford Works technical progress letter No. 236, January 2–January 8, [1949], 16:34083 (R;US)
Hanford Works technical progress letter No. 245, March 6–March 12, [1949], 16:34084 (R;US)
Hanford Works technical progress letter No. 246, March 13–March 19, 1949, 16:34085 (R;US)
Hanford Works technical progress letter No. 259, August 11–August 25, 1949, 16:34088 (R;US)
Hanford Works technical progress letter No. 265, November 11–November 25, [1949], 16:34092 (R;US)
Hanford Works technical progress letter No. 268, December 26, [1949]–January 10, [1950], 16:34094 (R;US)
Irradiation Processing Department Monthly report April, 1962, 16:34107 (R;US)
Irradiation Processing Department monthly record report November, 1959, 16:34105 (R;US)
Irradiation Processing Department monthly record report, June 1959, 16:34103 (R;US)
Irradiation Processing Department monthly report, October 1962, 16:34109 (R;US)
Operational interruption, B Reactor, September 12, 1959, 16:34104 (R;US)
Process and operating improvements for the second quarter of 1948, 16:34081 (R;US)
Process control and technical data: Six oldest Hanford production reactors: Hazards summary report, Volume 2, 16:34108 (R;US)
Slightly enriched uranium-thoria loading Hanford K production reactors: Hazards summary report, Supplement 1, 16:34198 (R;US)
Technical activities report on pile physics, 16:34100 (R;US)
Technical activities report, June 1952: Pile Physics, 16:34099 (R;US)
Technical progress letter for April 1950, 16:34096 (R;US)
Technical progress letter for February 1951, 16:34098 (R;US)
Tube 3560-KW flow stoppage incident Corrective Action Task Force charter: Supplement 1, 16:34065 (R;US)
Variables in Hanford reactor production after water plant expansion, 16:34101 (R;US)

**Reactor Physics**
Hazards Summary Report: Volume 2, Process control and technical data, Hanford K Production Reactors, 16:34045 (R;US)

**Safety Analysis**
Safety analysis and hazards evaluation: Six oldest Hanford production reactors: Hazards summary report, Volume 1, 16:34197 (R;US)

**Scram**
Operational interruption, B Reactor, September 12, 1959, 16:34104 (R;US)

**Site Characterization**
Hazards Summary Report: Volume 3, Description of the 100-KE and the 100-KW production reactor plants, 16:34057 (R;US)

**Tubes**
In-core gamma traverse of tube 3560 from tube 3561: 105-KW, July 13, 1968, 16:34134 (R;US)

**HANFORD RESERVATION**
1991 Yearly calibration of Pacific Northwest Laboratory's gross gamma-ray borehole geophysical logging system, 16:33809 (R;US)
Bioremediation of Hanford groundwater, 16:35083 (R;US)
Check list of W problems, 16:33721 (R;US)
Hanford Federal Facility Agreement and Consent Order quarterly progress report for the period ending June 30, 1991, 16:33804 (R;US)
PORMC: A model for Monte Carlo simulation of fluid flow, heat, and mass transport in variably saturated geologic media, 16:33798 (R;US)
Photography and audio-visual management system overview, 16:35549 (RA;US)
Quarterly report of RCRA groundwater monitoring data for period April 1, 1991 through June 30, 1991, 16:35076 (R;US)
Radioactive zinc ($^{65}$Zn), zinc, cadmium, and mercury in the Pacific Hake, Merluccius productus (Ayres), off the West Coast of the United States, 16:35085 (R;US)
Soil washing results for mixed waste pond soils at Hanford, 16:35065 (R;US)
Solid Waste Program Plan: Revision 1, 16:33794 (R;US)
Tank Farm Upgrades Program Plan, 16:33795 (R;US)
Tank farm surveillance and waste status report for April 1991, 16:33793 (R;US)
Westinghouse Hanford Company Environmental surveillance annual report–200/600 Areas: Calendar year 1990, 16:35022 (R;US)

**HAPO**
Hanford Engineer works technical progress letter No. 167, September 7 through September 13, 16:34070 (R;US)
Hanford Laboratories Operation, monthly activities report, December 1960, 16:34106 (R;US)
Hanford Laboratories monthly activities report, February, 1963, 16:34110 (R;US)
Hanford Works technical progress letter No. 203, May 16–May 22, [1948], 16:34079 (R;US)
Hanford Works technical progress letter No. 236, January 2–January 8, [1949], 16:34083 (R;US)
Hanford Works technical progress letter No. 245, March 6–March 12, [1949], 16:34084 (R;US)
Hanford Works technical progress letter No. 259, August 11–August 25, 1949, 16:34088 (R;US)
Hanford Works technical progress letter No. 265, November 11–November 25, [1949], 16:34092 (R;US)
Hanford Works technical progress letter No. 268, December 26, [1949]–January 10, [1950], 16:34094 (R;US)

**HARMONIC GENERATION**
Even harmonic lasing, 16:34848 (R;US)

**HAWAII**
The Hawaii experience: Problems with geothermal energy development and the growing opportunities for solar thermal electric technology, 16:33861 (RA;US)

**HAYNES 188 ALLOY**
Development of weldments for sulfur-containing combustion environments, 16:33618 (R;US)

**HAZARDOUS MATERIALS**
**Detoxification**
Preliminary design of a solar detoxification field experiment, 16:33892 (RA;US)
Recent results and implications of large-scale solar detoxification of water experiments at Sandia National Laboratories, 16:33896 (RA;US)
Solar Detoxification Program, 16:33876 (RA;US)
Solar Water Detoxification Program review, 16:33891 (RA;US)
**Encapsulation**
Long-term durability of polyethylene for encapsulation of low-level radioactive, hazardous, and mixed wastes, 16:33735 (R;US)
**Environmental Effects**
Characterization studies on: (A) Contaminated batch of Rocky Flats soil (B) Uncontaminted batch of INEL soil, 16:35056 (R;US)
**Environmental Transport**
Effect of radon dose on cleanup criteria and using RESRAD for chemical risk assessment, 16:35023 (R;US)
**Minimization**
US Department of Energy Idaho Operations Office Waste Minimization and Pollution Prevention Awareness Plan, 16:33739 (R;US)
**Monitoring**
Development of simple, powerful and economic measuring methods for control of hazardous materials at work places using thermal analysis, 16:35008 (I;DE;In German)
**Radioactive Waste Processing**
Treatability study for WAG 6 (SWSA 6) trench water, 16:35081 (R;US)
**Regulations**
US Department of Energy Idaho Operations Office Waste Minimization and Pollution Prevention Awareness Plan, 16:33739 (R;US)
**Research Programs**
R&D activities at DOE applicable to mixed waste, 16:33734 (R;US)
**Risk Assessment**
Effect of radon dose on cleanup criteria and using RESRAD for chemical risk assessment, 16:35023 (R;US)
**Thermal Analysis**
Development of simple, powerful and economic measuring methods for control of hazardous materials at work places using thermal analysis, 16:35008 (I;DE;In German)
**Underground Disposal**
Robotics subsurface mapping demonstration technology test plan, 16:34783 (R;US)
Treatability study for WAG 6 (SWSA 6) trench water, 16:35081 (R;US)
**Vitrification**
Influence of natural convection on melt shape during in situ vitrification, 16:35054 (R;US)
**Waste Disposal**
Need to use probabilistic risk approach in performance assessment of waste disposal facilities, 16:33784 (R;US)
Treatability study for WAG 6 (SWSA 6) trench water, 16:35081 (R;US)
**Waste Management**
The mixture rule under the Resource Conservation and Recovery Act: RCRA Information Brief, September 1991, 16:34250 (R;US)

**HB ROBINSON-2**
*See* ROBINSON-2 REACTOR

**HCLWR TYPE REACTORS**
Experimental study of power distribution in FCA XV cores with half-inserted $B_4C$ control rod, 16:34049 (R;JP;In Japanese)

**HD 8077**
*See* NICKEL BASE ALLOYS

**HEALTH HAZARDS**
Modeling of water spraying of field releases of hydrogen fluoride, 16:34988 (R;US)

**HEALTH PHYSICS**
*See* RADIATION PROTECTION

**HEAT EXCHANGERS**
A methodology for establishing surface area targets for the synthesis of constrained heat exchanger networks, 16:34362 (RA;US)
Chemistry and microbiology in the field of energy storage in an aquifer. Report on phase I, annexes: volume II: Programme Annex VI of the International Energy Agency, 16:33908 (R;CH;In French)
Predictive modelling of boiler fouling: Quarterly technical progress report, April 1, 1991–June 30, 1991, 16:33969 (R;US)
Research in oil burner design and emissions control, 16:33675 (RA;US)
Thermal performance analysis for heat exchangers having a variable overall heat transfer coefficient, 16:34824 (R;US)

**HEAT FLOW**
Thermal balance of groundwater Hasle-Burgdorf. Short report: Period of investigation 1986-1987, 16:34320 (R;CH;In German)

**HEAT FLUX**
*See also* CRITICAL HEAT FLUX
A 2-D imaging heat-flux gauge, 16:34953 (R;US)

**HEAT PIPES**
Testing of advanced ceramic fabric heat pipe for a Stirling engine, 16:34027 (R;US)

**HEAT PUMPS**
*See also* GROUND SOURCE HEAT PUMPS
A computer model for simulation of absorption systems in flexible and modular form, 16:34339 (R;US)
Long distance energy supply with heat pumps. Short report: Guide to practical realisation, 16:34319 (R;CH;In German)
Temperature of groundwater and plant-growth in Utzenstorf-Aefligen. Short report: Period of investigation 1985-1988, 16:35077 (R;CH;In German)

**HEAT SINKS**
Sintered compacts for heat sinks and process for fabricating same, 16:34521 (R;US)

**HEAT SOURCES (RADIOISOTOPE)**
*See* RADIOISOTOPE HEAT SOURCES

**HEAT TRANSFER**
*See also* CONVECTION
RADIANT HEAT TRANSFER
THERMAL CONDUCTION
Further development of the KIVA-DCH code for the analysis of the transport and chemical reaction of molten debris in direct containment heating experiments, 16:34210 (R;US)

**HEAT TRANSFER FLUIDS**
Measurements of heat and mass transfer coefficients during absorption of water vapor by lithium bromide and $(Li,K,Na)NO_3$ mixtures, 16:34823 (R;US)

**HEAT TRANSMISSION**
*See* HEAT TRANSFER

**HEATER OIL**
*See* HEATING OILS

**HEATERS**
Three-dimensional simulations of airflow through an electrically heated screen using the spectral-element code NEKTON, 16:34831 (R;US)

**HEATING OILS**
Fuel quality - An industry perspective, 16:33672 (RA;US)
Fuel sulfur content, sulfur-oxide emission and corrosion in oil heating plants, 16:33670 (RA;US)
Fuels, fuel quality, and storage, 16:33671 (RA;US)
Workshop group A - Fuels, fuel quality and storage, 16:33673 (RA;US)

**HEATING SYSTEMS**
*See also* SOLAR HEATING SYSTEMS
Oil heat technology for the 21st century. An overview of the BNL/DOE combustion equipment technology program, 16:34309 (RA;US)
Retrofit potential and fuel quality effects for residential oil heating systems to improve efficiency and reduce emissions, 16:33676 (RA;US)

Workshop group B - Education and technology transfer, 16:34238 (RA;US)

**HEAVY ION ACCELERATORS**

XENON 129 REACTIONS

**Calculation Methods**
Energy density, stopping and flow in ultrarelativistic heavy ion collisions, 16:35298 (RA;US)

**Data Analysis**
HBT measurements in relativistic heavy ion collisions, 16:35251 (RA;US)

**Experiment Planning**
810 future plans, 16:35246 (RA;US)
Rare composite objects 2 experiments, 16:35252 (RA;US)

**Experimental Data**
Experimental results concerning global observables from the CERN SPS heavy ion program, 16:35245 (RA;US)

**H Codes**
Secondary interactions in HIJET, 16:35292 (RA;US)

**Multiple Production**
Production of rare composite objects in relativistic heavy ion collisions, 16:35253 (RA;US)

**Nuclear Fireball Model**
Formation and break-up of hadronic fireballs, 16:35293 (RA;US)
Kaon enhancement as an evidence for chiral restoration in hot dense nuclear matter formed in heavy-ion collisions, 16:35299 (RA;US)

**Nuclear Fragments**
Studies of complex fragment emission in heavy ion reactions: Progress report, September 1, 1990–August 31, 1991, 16:35257 (R;US)

**Nuclear Models**
Scaling in fragmentation of target spectators, 16:35295 (RA;US)
Spectra of secondary particles from nuclear collisions at ultrarelativistic energies, 16:35300 (RA;US)

**Nuclear Reaction Kinetics**
What do we learn from transverse energy distributions?, 16:35290 (RA;US)

**Photoproduction**
Ultrarelativistic heavy-ion collisions and the formation of new particles, 16:35306 (R;DE)

**Pionization**
Shape of pion $p_T$-spectra, 16:35296 (RA;US)

**Probes**
Dilepton production theory, 16:35297 (RA;US)

**Research Programs**
Investigations of nuclear structure and nuclear reactions induced by complex projectiles: Progress report, September 1, 1990–August 31, 1991, 16:35258 (R;US)
Recent results from EMU01, 16:35244 (RA;US)
Studies of heavy-ion reactions and transuranic nuclei: Progress report, September 1, 1990–August 31, 1991, 16:35259 (R;US)
Workshop on heavy ion physics at the AGS: Outlook, 16:35254 (RA;US)

**Reviews**
Directions of heavy ion research at low and intermediate energies, 16:35262 (R;DE)

**String Models**
Comparison of string models for heavy ion collisions, 16:35291 (RA;US)

**Transverse Energy**
What do we learn from transverse energy distributions?, 16:35290 (RA;US)

**Transverse Momentum**
Hydrodynamical analysis of transverse momentum distributions in ultrarelativistic heavy ion collisions, 16:35294 (RA;US)

**HEAVY IONS**
ISOL based radioactive nuclear beam facilities, 16:34891 (R;JP)

**HEAVY OILS**

**LANTHANUM 139 TARGET**
Results of CJD calculations on the REAL-88 project, 16:35279 (RA;XA)

**LANTHANUM CHROMITES**
*See* CHROMIUM OXIDES
LANTHANUM OXIDES

**LANTHANUM COMPLEXES**
Study of complexes formed with complexones of aminocarboxylic and aminophosphonic series by $^{13}C$ and $^{31}P$ NMR method with the use of paramagnetic selective relaxants, 16:34656 (IA;SU;In Russian)

**LANTHANUM COMPOUNDS**
*See also* LANTHANUM FLUORIDES
LANTHANUM NITRIDES
LANTHANUM OXIDES
LANTHANUM SILICATES
LANTHANUM SULFIDES
Synthesis and certain physico-chemical properties of lanthanum and yttrium dichlorofluorides, 16:34715 (IA;SU;In Russian)

**LANTHANUM FLUORIDES**
Electric conductivity of solid electrolytes on the basis of $LaF_3$, 16:34703 (IA;SU;In Russian)
High purity fluorides of elements for fiber optics, 16:34687 (IA;SU;In Russian)
Use of ionic conductors on the basis of lanthanum fluoride for developing chemical sensors, 16:34714 (IA;SU;In Russian)

**LANTHANUM NITRIDES**
Use of ionic conductors on the basis of lanthanum fluoride for developing chemical sensors, 16:34714 (IA;SU;In Russian)

**LANTHANUM OXIDES**
Anharmonic lattice interaction and structural phase transition of the high-temperature superconductor $La_{2-x}Sr_xCuO_4$, 16:34539 (R;DE;In German)
Borolanthanum glasses with strontium and yttrium fluorides, 16:34562 (IA;SU;In Russian)
Realistic electronic structure calculations of magnetic insulators like $La_2CuO_4$, 16:35174 (R;US)

**LANTHANUM SILICATES**
The synthesis, characterization and catalytic reactions of metal silicate catalysts for the partial oxidation of methane, 16:33716 (RA;US)

**LANTHANUM SULFIDES**
Use of ionic conductors on the basis of lanthanum fluoride for developing chemical sensors, 16:34714 (IA;SU;In Russian)

**LASER FUSION REACTORS**
An analysis of grazing incidence metal mirrors in a laser ICF reactor driver, 16:35474 (R;US)
LLE review quarterly report, April–June 1991: Volume 47, 16:35435 (R;US)

**LASER MIRRORS**
An analysis of grazing incidence metal mirrors in a laser ICF reactor driver, 16:35474 (R;US)

**LASER RADIATION**
Irradiance compensation control for high-energy laser propagation: Part 2, Discrete actuator simulation, 16:35374 (R;US)

**LASER SPECTROSCOPY**
Gaseous phase molecular spectroscopy with infrared-tunable diode lasers, 16:34589 (R;IT;In Italian)

**LASER-PRODUCED PLASMA**
LLE review quarterly report, April–June 1991: Volume 47, 16:35435 (R;US)

**LASERS**
*See also* FREE ELECTRON LASERS
Contributions to the international conference on laser '89, 16:34842 (R;IT;In Italian)

Evaluation report on SCTF Core-III Test S3-22: Investigation of water break-through and core cooling behaviors under alternate ECC water delivery from hot legs to upper plenum during reflooding in PWRs with combined-injection type ECCS, 16:34050 (R;JP)
Review studies on the state of the art of separate effects and component behaviour of LWR cooling systems, 16:34183 (R;FR)

**LOSS OF FLOW**
**Administrative Procedures**
Tube 3560 KW flow stoppage incident corrective action procedure No. 10: 140 psi measured leak test on front section of tube 3560, 16:34145 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 10: Rear gunbarrel removal and dummy gunbarrel installation on channel 3560, 16:34141 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 11: Through-tube water transmission test, 16:34146 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 12: Borescope examination of upstream fuel piece, 16:34147 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 14, 16:34148 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 15: Borescope examination of upstream fuel pieces through transfer mechanism, 16:34149 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 21: Thermal shield and die block cutting, 16:34157 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 23, Graphite boring over process tube: Revision 1: Supplement 25, 16:34159 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 24 - Tube removal through bored channel, 16:34160 (R;US)

Tube 3560 KW flow stoppage incident corrective action procedure No. 4: 200 psi hydraulic test of front section of tube 3560, 16:34140 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 7: Borescope examination of downstream fuel piece, 16:34143 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 8: Removal of front cap from tube 3560 KW, 16:34144 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 9: Fuel removal from front, 16:34150 (R;US)
Tube 3560 KW flw stoppage incident corrective action procedure No. 6: Alternate No. 2 rear fuel element removal procedure, 16:34142 (R;US)

**Emergency Plans**
Tube 3560 KW flow stoppage incident corrective action procedure No. 10: 140 psi measured leak test on front section of tube 3560, 16:34145 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 10: Rear gunbarrel removal and dummy gunbarrel installation on channel 3560, 16:34141 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 11: Through-tube water transmission test, 16:34146 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 12: Borescope examination of upstream fuel piece, 16:34147 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 14, 16:34148 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 15: Borescope examination of upstream fuel pieces through transfer mechanism, 16:34149 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 21: Thermal shield and die block cutting, 16:34157 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 23, Graphite boring over process tube: Revision 1: Supplement 25, 16:34159 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 24 - Tube removal through bored channel, 16:34160 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 4: 200 psi hydraulic test of front section of tube 3560, 16:34140 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 7: Borescope examination of downstream fuel piece, 16:34143 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 8: Removal of front cap from tube 3560 KW, 16:34144 (R;US)
Tube 3560 KW flow stoppage incident corrective action procedure No. 9: Fuel removal from front, 16:34150 (R;US)
Tube 3560 KW flw stoppage incident corrective action procedure No. 6: Alternate No. 2 rear fuel element removal procedure, 16:34142 (R;US)
Tube 3560-KW flow stoppage incident Corrective Action Task Force charter: Supplement 1, 16:34065 (R;US)

**LOW LEVEL COUNTING**
Justification for reporting negative value counting results as an alternative to minimum detectable activity, 16:35533 (R;US)

**LOW-LEVEL RADIOACTIVE WASTES**
1990 State-by-State assessment of low-level radioactive wastes received at commercial disposal sites: National Low-Level Waste Management Program, 16:33746 (R;US)
Archaeological mounds as analogs of engineered covers for waste disposal sites: Literature review and progress report, 16:33772 (R;US)
Long-term durability of polyethylene for encapsulation of low-level radioactive, hazardous, and mixed wastes, 16:33735 (R;US)
Optimization of measurement techniques for very low-level radioactive waste material, 16:34936 (R;FR)
Proposed plan for vitrification demonstration of low-level radioactive wastes at the Fernald Environmental Management Project, 16:33757 (R;US)
Quarterly report of RCRA groundwater monitoring data for period April 1, 1991 through June 30, 1991, 16:35076 (R;US)
Treatability study for WAG 6 (SWSA 6) trench water, 16:35081 (R;US)
Tritium migration studies at the Nevada Test Site, 16:33747 (R;US)

**LUBRICANTS**

**MOLECULES**
Control of electron transfer rates by motions of atoms and molecules, 16:35170 (R;US)
Properties of liquid water and carbon dioxide from constant temperature-constant temperature molecular dynamics, 16:35181 (R;US)

**MOLTEN CARBONATE FUEL CELLS**
Cathode dissolution, 16:34293 (RA;US)
Corrosion of materials in molten carbonate fuel cells, 16:34289 (RA;US)
Development of a coal-fueled internal manifold heat exchanger (IMHEX) molten carbonate fuel cell stack, 16:34294 (RA;US)
Development of internal reforming MCFC stack technology, 16:34290 (RA;US)
EPRI fuel cell program, 16:34275 (RA;US)
Effect of coal-derived trace species on the performance of molten carbonate fuel cells, 16:34297 (RA;US)
Electrode reaction mechanisms in molten carbonate fuel cells, 16:34296 (RA;US)
IFC MCFC technology status, 16:34287 (RA;US)
IMHEX power plant system, 16:34295 (RA;US)
MCFC systems, coal-gas based, 16:34291 (RA;US)
Molten carbonate fuel cell research, 16:34298 (RA;US)
Oxygen electrode in molten carbonate fuel cells, 16:34292 (RA;US)
Review of system studies - Task 3 molten carbonate fuel cell technology improvements, 16:34288 (RA;US)

**MOLYBDATES**
Effect of secondary cations on structure of dimolybdatouranylate complexes, 16:34631 (IA;SU;In Russian)

**MOLYBDENUM**
Dislocation loop growth in molybdenum under HVEM irradiation, 16:34489 (IA;SU;In Russian)
Effect of decrease of molybdenum radiation hardening at high energy proton irradiation, 16:34488 (IA;SU;In Russian)
Regularities and mechanism of radiation-induced atmospheric corrosion of metals, 16:34454 (IA;SU;In Russian)

**MOLYBDENUM 94**
Excitation of the Δ resonance in proton-nucleus collisions, 16:35272 (R;DE;In German)

**MOLYBDENUM ALLOYS**
*See also* ALLOY-RA-333
MOLYBDENUM BASE ALLOYS
Creep response of a 9Cr-1Mo-V-Nb steel to varying stresses and temperatures, 16:34432 (R;US)

**MOLYBDENUM BASE ALLOYS**
Influence segregation processes on radiation effects in vanadium, niobium and molybdenum alloys at different temperatures of neutron irradiation, 16:34487 (IA;SU;In Russian)

**MOLYBDENUM COMPLEXES**
Composition and structure of molybdenum complexes in aqueous and organic media and solid products, 16:34659 (IA;SU;In Russian)
Controlled synthesis of polyenes by catalytic methods: Progress report, August 1, 1990–July 31, 1991, 16:34606 (R;US)
Correlation between stereochemistry and circular dichroism spectra of transition metal chiral binuclear clusters, 16:34621 (IA;SU;In Russian)
Features of thiosulfate ion complexing with metals, 16:34655 (IA;SU;In Russian)
Investigation of molybdenum (0) bisarene complexes in vapour phase by the method of electron absorption spectroscopy, 16:34645 (IA;SU;In Russian)
Mo(6) complexonates with 1-hydroxyethylidenediphosphonic acid ($H_4L$), 16:34622 (IA;SU;In Russian)
Molybdenum and tungsten complexing in sodium metaphosphate base melts, 16:34618 (IA;SU;In Russian)
Polynuclear cluster compounds with systems of metal-metal delocalized bonds of high multiplicity (Clusters of Mo, W, Tc, Re.), 16:34615 (IA;SU;In Russian)
Structure and state of molybdenyl (6) complexes with some dioxin nonpolar solvents, 16:34666 (IA;SU;In Russian)
Structure of Mo(6) dioxocomplexes with Schiff bases on the basis of acylhydrazones of salicylic aldehyde, 16:34674 (IA;SU;In Russian)
Structure of three monooxychloride transition metal complexes with 18-crown-6, 16:34637 (IA;SU;In Russian)
X-ray diffraction study of metal alcoholates, 16:34612 (IA;SU;In Russian)

**MOLYBDENUM COMPOUNDS**
*See also* MOLYBDATES
MOLYBDENUM OXIDES
MOLYBDENUM SULFIDES
Transition metal ion complexing with polyoxomolybdate $[Al(OH)_6Mo_6O_{18}]^{3-}$ according to $^{17}O$ and $^{95}Mo$ NMR, M=$Zn^{2+}$-$Mn^{2+}$, 16:34667 (IA;SU;In Russian)

**MOLYBDENUM OXIDES**
Diffuse reflection electron spectroscopy study of radiolysis of alumonickelmolybdenum oxide systems in accelerated electron beam, 16:34737 (IA;SU;In Russian)
Mechanism of hydrodenitrogenation low temperature oxygen chemisorption over acidic molybdenum catalysts: Part 7: Seventh quarter report, April 1–June 30, 1991, 16:33565 (R;US)

**MOLYBDENUM SULFIDES**
Alkali/$TX_2$ catalysts for $CO/H_2$ conversion to $C_1$–$C_4$ alcohols: Technical progress report, March–May 1991, 16:33563 (R;US)
Interim report on conversion of coal to liquids via catalytic hydropyrolysis, 16:33586 (R;US)
Reduced molybdenum oxidation states in hydrodesulfurization catalysis by Chevrel phases, 16:34728 (R;US)

**MONGOLIAN PEOPLES REPUBLIC**
Country paper - Mongolia, 16:33961 (RA;DK)

Natural gas recovery/utilization SBIR program, 16:34257 (RA;US)
Natural gas to liquids, 16:33707 (RA;US)
Suprabiotic catalyst systems for selective oxidation of light alkane gases to fuel oxygenates, 16:33711 (RA;US)
US energy flow, 1990, 16:34270 (R;US)

**NATURAL GAS DEPOSITS**
*See also* NATURAL GAS FIELDS
**Engineering Geology**
Geotechnology for low-permeability gas reservoirs, 16:33681 (RA;US)
**Exploration**
An evaluation of co-planar lineament analysis and some thoughts on using surface geological data to predict subsurface geology, 16:33682 (RA;US)
International oil and gas exploration and development activities: Quarterly report, October–December 1990, 16:33666 (R;US)
Multi-strata exploration and production study, 16:33685 (RA;US)
Western tight gas sands research, 16:34256 (RA;US)
**Geologic Models**
Kinetic models of hydrocarbon generation, 16:33651 (RA;US)
**Geologic Structures**
Infield reserve growth/secondary natural gas recovery: Targeted technology applications for infield reserve growth - Year two report, 16:33689 (RA;US)
**Geology**
Systems analysis of low permeability natural gas formations in the western United States, 16:33680 (RA;US)
The Geoscience Center at METC, 16:34254 (RA;US)
**Geophysical Surveys**
Geophysical reconnaissance for deep methane source rocks, 16:33690 (RA;US)
**Remote Sensing**
Application of remote geologic analysis to gas exploration in Devonian shale, 16:33697 (RA;US)
**Research Programs**
Deep gas, 16:33687 (RA;US)
Eastern tight gas project, 16:33684 (RA;US)
Natural gas recovery/utilization SBIR program, 16:34257 (RA;US)
Potential for natural gas resources in deep sedimentary basins, 16:33691 (RA;US)
Western gas research, 16:33678 (RA;US)
**Resource Assessment**
Clathrates in the Arctic regions, 16:33696 (RA;US)
Extrapolation of MWX data into the Piceance Basin, Colorado, 16:33683 (RA;US)
Gas hydrates of the Arctic, 16:33695 (RA;US)
Preliminary report on the characterization of Tertiary and Cretaceous low-permeability (tight) gas-bearing rocks in the Uinta Basin, Utah, 16:33679 (RA;US)
Systems analysis of low permeability natural gas formations in the western United States, 16:33680 (RA;US)
**Resource Development**
Deep gas, 16:33687 (RA;US)
Eastern gas analysis - A systems approach, 16:34255 (RA;US)
Eastern tight gas project, 16:33684 (RA;US)
Systems analysis of natural gas resources from low-permeability formations, 16:33713 (RA;US)
Western gas research, 16:33678 (RA;US)
**Resource Potential**
Exploration for deep source hydrocarbons in subduction terrain of the Pacific Northwest, 16:33650 (RA;US)
Potential for natural gas resources in deep sedimentary basins, 16:33691 (RA;US)
Terrestrial gas hydrate occurrences, 16:33692 (RA;US)
**Seismic Surveys**
Deep source gas seismic survey - Washington state, 16:33694 (RA;US)
Seismic interpretation of gas hydrates in the Blake Ridge area, 16:33693 (RA;US)
**NATURAL GAS FIELDS**
Extrapolation of MWX data into the Piceance Basin, Colorado, 16:33683 (RA;US)
**NATURAL GAS INDUSTRY**
US energy industry financial developments: 1991 Second quarter, 16:33667 (R;US)
**NATURAL GAS WELLS**
**Directional Drilling**
Drilling and completion of a horizontal Devonian shale well: Martin County, Kentucky, 16:33703 (RA;US)
Geotechnical evaluations for siting horizontal wells in Devonian shale reservoirs, 16:33714 (RA;US)
Horizontal wells in the Devonian shale, 16:33702 (RA;US)
PrimeEnergy/DOE/GRI slant well: A directional drilling case history, 16:33704 (RA;US)
Results of horizontal well site evaluations in fractured Devonian shale reservoirs, 16:33686 (RA;US)
Slant hole completion test Mesaverde Group, Piceance Basin, Colorado, 16:33699 (RA;US)
Western tight gas sands research, 16:34256 (RA;US)
**Fluid Injection**
Study of hydrate dissociation by methanol and glycol injection, 16:33706 (RA;US)
**Hydraulic Fracturing**
Drilling and completion of a horizontal Devonian shale well: Martin County, Kentucky, 16:33703 (RA;US)
Horizontal wells in the Devonian shale, 16:33702 (RA;US)
Hydraulic fracturing of the Devonian shale with a non-damaging fluid, 16:33700 (RA;US)
PrimeEnergy/DOE/GRI slant well: A directional drilling case history, 16:33704 (RA;US)
**Production**
Horizontal wells in the Devonian shale, 16:33702 (RA;US)
Western tight gas sands research, 16:34256 (RA;US)
**Productivity**
Infield reserve growth/secondary natural gas recovery: Targeted technology applications for infield reserve growth - Year two report, 16:33689 (RA;US)
**Reservoir Engineering**
Eastern gas systems analysis: Devonian Shales - Tight sands, 16:33705 (RA;US)
Multi-strata exploration and production study, 16:33685 (RA;US)
Western tight gas sands research, 16:34256 (RA;US)
**Site Selection**
Geotechnical evaluations for siting horizontal wells in Devonian shale reservoirs, 16:33714 (RA;US)
Horizontal wells in the Devonian shale, 16:33702 (RA;US)
Results of horizontal well site evaluations in fractured Devonian shale reservoirs, 16:33686 (RA;US)
**Well Completion**
Slant hole completion test Mesaverde Group, Piceance Basin, Colorado, 16:33699 (RA;US)

Mechanism of hydrodenitrogenation low temperature oxygen chemisorption over acidic molybdenum catalysts: Part 7: Seventh quarter report, April 1–June 30, 1991, 16:33565 (R;US)
Oxygen electrode in molten carbonate fuel cells, 16:34292 (RA;US)
Oxygen transfer problems in coal processing bioreactors, 16:33584 (R;US)
Perfluorosulfonic acid polymer films in phosphoric acid fuel cells, 16:34306 (RA;US)
Reduced molybdenum oxidation states in hydrodesulfurization catalysis by Chevrel phases, 16:34728 (R;US)
Use of xenon difluoride for oxygen extraction and determination in superconducting ceramics $YBa_2Cu_3O_{7-x}$, 16:34591 (IA;SU;In Russian)

**OXYGEN 16 REACTIONS**
Charged particle distributions in heavy ion collisions at 14.6 GeV A/c, 16:35276 (RA;US)
$E_T$ distributions, nuclear stopping, and correlations among measurements from the 4 detector systems in AGS E802, 16:35277 (RA;US)
Recent CERN results on HBT, strangeness and $p_T$-spectra from $^{16}O,^{32}S$-nucleus collisions at 200 GeV/nucleon, 16:35248 (RA;US)

**OXYGEN 17**
Dynamic-angle spinning and double rotation of quadrupolar nuclei, 16:35273 (R;US)

**OXYGEN 18 REACTIONS**
The new nuclide $^{263}$Ha, 16:35288 (R;DE)

**OXYGEN COMPLEXES**
Reactivity of young chars via energetic distribution measurements: Quarterly technical progress report, December 15, 1990–March 15, 1991, 16:33581 (R;US)

**OXYGEN COMPOUNDS**
*See also* ALUMINATES
CARBONATES
FERRITES
IODATES
MOLYBDATES
PEROXIDES
PERRHENATES
PHOSPHATES
SILICATES
SULFATES
TANTALATES
WATER
The dual role of oxygen functions in coal pretreatment and liquefaction: Crosslinking and cleavage reactions: First quarterly report, April 2, 1991–June 30, 1991, 16:33583 (R;US)

**OXYGEN EFFECT (RADIOBIOLOGY)**
*See* OXYGEN

**OXYGEN HYDRIDES**
*See* WATER

**OXYGEN IONS**
Progress in collisions of multiply charged ions, 16:35171 (R;US)

**OXYMETHYLENE**
*See* FORMALDEHYDE

**OZONE**
Physico-chemical behaviour analysis of air pollutants in a complex coastal site: Castellon, 16:34990 (R;ES;In Spanish)

**1,2,3-PROPANETRIOL**
*See* GLYCEROL

**1-PROPANOL**
*See* PROPANOLS

## P

**P CODES**
PORMC: A model for Monte Carlo simulation of fluid flow, heat, and mass transport in variably saturated geologic media, 16:33798 (R;US)
PROSA version 4.0 manual, 16:33813 (R;DE)

**PACIFIC GAS DIABLO CANYON-1 REACTOR**
*See* DIABLO CANYON-1 REACTOR

**PACIFIC GAS DIABLO CANYON-2 REACTOR**
*See* DIABLO CANYON-2 REACTOR

**PACIFIC NORTHWEST LABORATORIES**
*See* BATTELLE PACIFIC NORTHWEST LABORATORIES

**PACKAGING**
Conceptual design for PSP mounting bracket, 16:34795 (R;US)

**PADUCAH PLANT**
Paducah Gaseous Diffusion Plant Environmental report for 1990: Volume 3, 16:34232 (R;US)

**PAH**
*See* POLYCYCLIC AROMATIC HYDROCARBONS

**PAINTS**
Low volatile organic compound paints, 16:34405 (R;US)
Solvent substitution with non-chlorinated biodegradable solvents, 16:34372 (R;US)

**PAKISTAN**
Wind energy in Pakistan, 16:33926 (RA;DK)

**PALISADES-1 REACTOR**
An aerial radiological survey of the area surrounding the Palisades Plant Nuclear Reactor Site (South Haven, Michigan): Date of survey: June 1976, 16:35050 (R;US)

**PALLADIUM**
Interim report on conversion of coal to liquids via catalytic hydropyrolysis, 16:33586 (R;US)
Methane oxidation over dual redox catalysts, 16:33710 (RA;US)
Probe molecule studies: Active species in alcohol synthesis: Third quarterly report, April 1991–June 1991, 16:33580 (R;US)
The structure and energetics of gas phase Ni and Pd clusters, 16:34493 (R;US)

**PALLADIUM ALLOYS**
Cluster expansion of fcc Pd-V intermetallics, 16:34511 (R;US)

**PALLADIUM COMPOUNDS**
Optical properties of MX chain materials: An extended Peierls-Hubbard model, 16:34565 (R;US)

**PAPER INDUSTRY**
Distribution of retention aid in the web of paper machine, 16:33827 (R;FI;In Finnish)
Fundamental studies of black liquor combustion: Report No. 4, Phases, 2, 3, and 4: Final report, December 1987–December 1989, 16:34369 (R;US)
KUITU Energy-efficient mechanical pulping: Interim report 1988-1990, 16:34396 (R;FI)
RAINA Energy-efficient paper production: Interim report 1988-1990, 16:34395 (R;FI)
Saving of electricity by controlling electrical equipment in the pulp and paper industry, 16:34402 (R;FI;In Finnish)

**PARABOLIC TROUGH COLLECTORS**
Applications of parabolic trough technology, 16:33903 (RA;US)
Low and medium flat plate technology for industrial process heating, 16:33904 (RA;US)
Stretched membrane parabolic trough system for process hot water/planned solar air conditioning system, 16:33889 (RA;US)

**PARAFFINS**
*See* ALKANES

**PARALLEL PROCESSING**
An assessment of the ModSim/TWOS parallel simulation environment, 16:35507 (R;US)
Compile-time partitioning of a non-strict language with side-effects into sequential threads, 16:35521 (R;US)
On finding minimum-diameter clique trees, 16:35515 (R;US)
Parallel programming with PCN, 16:35496 (R;US)
Studying parallel program behavior with upshot, 16:35495 (R;US)

**PARTIAL DIFFERENTIAL EQUATIONS**
A domain decomposition algorithm for solving large elliptic problems, 16:35530 (R;US)

**PARTICLE BEAMS**
Effect of magnet misalignment on neutral beam aberration coefficients, 16:34870 (R;US)

**PARTICLE PRODUCTION**
Jet rates from deep inelastic muon scattering in the W range of 15 to 35 GeV, 16:35228 (R;US)
Mini-jet and particle production in ultra-relativistic heavy ion collisions, 16:35211 (R;US)
Update to the RHIC Letter of Intent for an experiment on particle and jet production at midrapidity, 16:35212 (R;US)

**PARTICULATES**
Catalytic fabric filtration for simultaneous $NO_x$ and particulate control: Quarterly technical progress report, April 1–June 30, 1991, 16:33980 (R;US)
Development of a non-radiological air emissions inventory for a nuclear industrial facility, 16:35018 (R;US)
Mechanics/heat-transfer relation for particulate materials [for July 1991]: [Quarterly report], 16:33631 (R;US)
Radiation heat transfer in particulate systems, 16:34808 (RA;US)
Stokes drag on self-similar clusters of spheres, 16:33638 (RA;US)

**PARTON MODEL**
Heavy quark production in panti p interaction at collider energies, 16:35223 (R;DE)

**PASSIVE SOLAR HEATING SYSTEMS**
Modular system for solar walls. Part 1: Technological and economical analysis. Final report, 16:33873 (I;DK;In Danish)
Solar communal housing at Preverenges: Report on technical installations: heating systems, ventilation, domestic hot water, 16:33868 (R;CH;In French)

**PATHOGENS**
Augmented fish health monitoring: Completion report (Part one of two volume): Volume 1, 16:33853 (R;US)

**PEAK LOAD**
Integrated estimation of commercial sector end-use load shapes and energy use intensities, Phase 2: Final report, Appendices, 16:34332 (R;US)

**PEAK POWER**
*See* PEAK LOAD

**PEAT**
ADEWA Artificial dewatering of peat: Interim report 1988-1990, 16:33546 (R;FI)
Development of energy economical cutting device and macerator suitable for different peat qualities, 16:33608 (R;FI;In Finnish)
Fast preparation and more accurate utilization of the peat production area, 16:33609 (R;FI;In Finnish)
Fundamentals of sod peat technology - field test machine and sod simulator research, 16:33606 (R;FI;In Finnish)
JALO Fuel conversion: Interim report 1988-1990, 16:34394 (R;FI)
OPTIMITURVE Peat production based on solar energy: Interim report 1988-1990, 16:33604 (R;FI)
Research results of the Optimiturve research program in 1990, 16:33610 (R;FI;In Finnish)
Sod-peat drying research, 16:33607 (R;FI;In Finnish)
The drying of milled peat, 16:33611 (R;FI;In Finnish)
The possibilities of aircraft photography in different stages of utilization of peatlands, 16:33605 (R;FI;In Finnish)
The rols and uptake of organic matter in lotic ecosystems, part 1, Environmental impacts of nitrogen loading from peat mining, areas in running waters, part 2, 16:35088 (R;FI;In Finnish)

**PEATLANDS**
*See* WETLANDS

**PELLET INJECTION**
An ablation rate model for time-dependent pellet ablation studies at Max-Planck-Institute, 16:35446 (R;DE)
Design of a tritium pellet injector for TFTR, 16:35429 (R;US)

**PELLETS**
*See also* FUEL PELLETS
Process development for production of coal/sorbent agglomerates: Technical report, March 1, 1991–May 31, 1991, 16:33544 (R;US)

**PELLETS (BREEDING)**
*See* BREEDING PELLETS

**PELLETS (FUEL)**
*See* FUEL PELLETS

**PENETROMETERS**
Continued development of hybrid directional boring technology and New horizontal logging development for characterization, monitoring and instrument emplacement at environmental sites, 16:33785 (R;US)

**PEOPLE**
*See* HUMAN POPULATIONS

**PEOPLES REPUBLIC OF CHINA**
*See* CHINA

**PERFORMANCE**
Need to use probabilistic risk approach in performance assessment of waste disposal facilities, 16:33784 (R;US)

**PERFORMANCE TESTING**
Exploratory Studies Facility alternatives study: Final report: Volume 1, Executive summary, supporting information, and study conclusions: Yucca Mountain Site Characterization Project, 16:33781 (R;US)
Exploratory Studies Facility alternatives study: Final report: Volume 2, A comparative evaluation of alternative exploratory studies facility options: Yucca Mountain Site Characterization Project (Yucca Mountain Project:a1), 16:33782 (R;US)

**PERMEABILITY COEFFICIENT (FLUID MECHANICS)**
*See* HYDRAULIC CONDUCTIVITY

**PERMEABILITY DAMAGE**
*See* FORMATION DAMAGE

**PERMEABILITY REDUCTION**
*See* FORMATION DAMAGE

**PEROXIDES**
Chemical coal cleaning using selective oxidation: Technical report, March 1, 1991–May 31, 1991, 16:33575 (R;US)

**PERRHENATES**
Structure of polycrystalline perrhenates from $^{185,187}Re$ NQR data, 16:34665 (IA;SU;In Russian)

**PERSONNEL**
*See also* MILITARY PERSONNEL
PROFESSIONAL PERSONNEL
REACTOR OPERATORS

Organizational Cultural Assessment of the Solar Energy Research Institute, 16:35479 (R;US)
Remote mechanical C line, 16:33801 (RA;US)
Susquehanna SES maintenance supervisor training and certification, 16:34132 (RA;US)

**PERSONNEL DOSIMETRY**
NVLAP and DOELAP dosimetry accreditation programs, 16:35326 (RA;US)

**PERSONNEL FILM DOSIMETRY**
*See* PERSONNEL DOSIMETRY

**PETRA STORAGE RING**
Transverse and longitudinal multi-bunch feedback systems for PETRA, 16:34920 (R;DE)

**PETROLEUM**
Annual report 1989, 16:34229 (I;GB)
Flow in porous media, phase and ultralow interfacial tensions: Mechanisms of enhanced petroleum recovery: Final report, 16:33656 (R;US)
Historical monthly energy review, 1973–1988, 16:34252 (R;US)
Monthly energy review, September 1991 (Contains glossary.), 16:34253 (R;US)
Petroleum marketing monthly, September 1991, 16:33664 (R;US)
Predictability of formation damage: An assessment study and generalized models: Quarterly report, January–March 1991, 16:33648 (R;US)
The depth of the oil/brine interface and crude oil leaks in SPR caverns, 16:33655 (R;US)
The thermodynamic properties of benzothiazole and benzoxazole, 16:33674 (R;US)
US energy flow, 1990, 16:34270 (R;US)

**PETROLEUM COKE**
*See* COKE
PETROLEUM PRODUCTS

**PETROLEUM DEPOSITS**
Exploration for deep source hydrocarbons in subduction terrain of the Pacific Northwest, 16:33650 (RA;US)
International oil and gas exploration and development activities: Quarterly report, October–December 1990, 16:33666 (R;US)
Kinetic models of hydrocarbon generation, 16:33651 (RA;US)

**PETROLEUM GEOLOGY**
Project "Dybseis": Deep seismic studies in the Jameson Land basin (Greenland), 16:33653 (I;DK)

**PETROLEUM INDUSTRY**
Annual report 1989, 16:34229 (I;GB)
National Energy Strategy: Technical Annex 4, Barriers to the use of horizontal drilling technology, 16:33659 (R;US)
US energy industry financial developments: 1991 Second quarter, 16:33667 (R;US)

**PETROLEUM PRODUCTS**
*See also* FUEL OILS
GASOLINE
LUBRICATING OILS
Historical monthly energy review, 1973–1988, 16:34252 (R;US)
Monthly energy review, September 1991 (Contains glossary.), 16:34253 (R;US)
Petroleum marketing monthly, September 1991, 16:33664 (R;US)
Petroleum supply monthly, September 1991, 16:33663 (R;US)
[California Energy Commission] quarterly oil report, first quarter 1991: Volume 11, No. 1, 16:33668 (R;US)

**PETROLEUM REFINERIES**
Petroleum supply monthly, September 1991, 16:33663 (R;US)

**PHASE CHANGE MATERIALS**
Advanced phase change materials and systems for solar passive heating and cooling of residential buildings: Final technical report, May 29, 1986–July 15, 1988, 16:33866 (R;US)

**PHENOLS**
Radiation-sorption processing of phenol-containing waters. Mathematical model of the process, 16:33822 (IA;SU;In Russian)

**PHOSPHATES**
Study of the radicnuclides contained in wastes produced by the phosphate industry and their impact on the environment, 16:35057 (R;FR)

**PHOSPHONIC ACID ESTERS**
Material balance of radiation-adsorption removal of chlorophos on AG-3 charcoal in the flow, 16:34746 (IA;SU;In Russian)

**PHOSPHORIC ACID**
Study of the interference of uranium, vanadium, aluminium and molebdenum in the determination of FeII, FeIII in Syrian phosphoric acid by spectrophotometry, 16:34580 (R;SY;In Arabic)

**PHOSPHORS**
*See also* LIQUID SCINTILLATORS
Subnanosecond scintillators based on alkali metal and alkali earth metal fluorides, 16:35344 (IA;SU;In Russian)

**PHOSPHORUS**
Electroless vs electrodeposited Ni-P alloys for diamond turning applications, 16:34518 (R;US)
Radiation-chemical transformations in heterogeneous systems containing elementary phosphorus, 16:34757 (IA;SU;In Russian)
X-ray diffraction study of structure of irradiated amorphous red phosphorus, 16:34558 (IA;SU;In Russian)

**PHOTOCATHODES**
Quantum yield measurements of photocathodes illuminated by pulsed ultraviolet laser radiation, 16:34902 (R;US)
Technical memo on new results on CsI photocathodes: Enhancement and aging, 16:34938 (R;US)

**PHOTODETECTORS**
Photon detector for MEGA: Progress report, July 16, 1990–July 15, 1991, 16:34934 (R;US)

**PHOTODISINTEGRATION**
*See* PHOTONUCLEAR REACTIONS

**PHOTOGRAPHY**
Geologic mapping of tunnels using photogrammetry-control-point configuration, 16:34961 (R;US)

**PHOTOMAGNETOELECTRIC EFFECT**
*See* MAGNETIC FIELDS

**PHOTON BEAMS**
Design and performance of beamline 7C at the Photon Factory, 16:34875 (R;JP)

**PHOTON DETECTION (GAMMA)**

**PHOTON TRANSPORT**
TART and ALICE input manual: Revision 3, 16:35527 (R;US)

**PHOTONS**
Progress in photon scanning-tunneling microscopy (PSTM), 16:34955 (R;US)

**PHOTONUCLEAR REACTIONS**
Deuteron photo- and electrodisintegration in the Bethe-Salpeter formalism, 16:35309 (R;UA;In Russian)
Photoproduction of charged and neutral pions in nuclei in the Δ-resonance region, 16:35302 (R;DE)

**PHOTORESISTORS**
Aqueous dryfilm photoresist for thin film network pattern gold electroplating, 16:34846 (R;US)

**PHOTOSYNTHESIS**
Division of Energy Biosciences annual report and summaries of FY 1991 activities, 16:35090 (R;US)

**PHOTOVOLTAIC CONVERSION**
Photovoltaics: New opportunities for utilities, 16:33854 (R;US)

**PHOTOVOLTAIC POWER SUPPLIES**
PV central receivers: Their potential role in solar-electric generation, 16:33858 (RA;US)
Technical specifications for photovoltaic systems for residential lighting in rural areas, 16:33857 (R;US)

**PHYTOCHROMES**
Mechanism for the selective conjugation of ubiquitin to phytochrome: Progress report for 1990, 16:35091 (R;US)

**PICEANCE CREEK BASIN**
Extrapolation of MWX data into the Piceance Basin, Colorado, 16:33683 (RA;US)

**PIGE ANALYSIS**
*See* PROMPT GAMMA RADIATION
PROTON REACTIONS

**PINS (FUEL)**
*See* FUEL PINS

**PION REACTIONS**
Interplay between pion absorption and inclusive-inelastic scattering on hydrogen and helium isotopes for 96.5-MeV kinetic energy pions, 16:35305 (R;US)

**PION-PION INTERACTIONS**
Signatures of unstable particles in finite volume, 16:35238 (R;DE)

**PIONS**
*See also* PIONS MINUS
PIONS NEUTRAL
PIONS PLUS
Particle production and spectra in E802 at BNL-AGS, 16:35193 (R;US)
Physics of the pion liquid, 16:35301 (RA;US)
Spectra of secondary particles from nuclear collisions at ultrarelativistic energies, 16:35300 (RA;US)
Unitarity and pion production in relativistic heavy-ion collisions, 16:35311 (R;US)

**PIONS MINUS**
Charged-pion production in non-peripheral proton-nucleus interactions at 800 and 1600 MeV incident energies, 16:35271 (R;FR)
Spectra and strangeness production, 16:35270 (RA;US)

**PIONS NEUTRAL**
Isolated single and double direct photon production at CDF, 16:35204 (R;US)
Putting in action the $4\pi$ $\gamma$ multidetector TAPS at Ganil, 16:34939 (R;FR;In French)

**PIONS PLUS**
Charged-pion production in non-peripheral proton-nucleus interactions at 800 and 1600 MeV incident energies, 16:35271 (R;FR)
Spectra and strangeness production, 16:35270 (RA;US)

**PIPELINES**
Ecological effects of pipeline construction through deciduous forested wetlands, Midland County, Michigan: Interim report, August 1988–August 1990, 16:33717 (R;US)
Experimental investigation of turbulent flows in pipe junctions, 16:34827 (I;DE;In German)

**PIPES**
Local phase distribution and interfacial area in a horizontal bubbly two-phase flow, 16:35176 (R;US)
Theories on the initiation of slug flow, 16:34819 (RA;US)
Ultrasonic inspection of the inner and outer surfaces of components in contact with liquids using horizontally polarized shear waves. Final report, 16:34834 (R;DE;In German)

**PISTONS**
Axial thrust balancing for small high-speed high-pressure rocket pumps, 16:34425 (R;JP;In Japanese)

**PITTSBURGH ENERGY TECHNOLOGY CENTER**
PETC's natural gas conversion program, 16:33708 (RA;US)

**PLANT BREEDING**
Genetic improvement and modified conventional culture of forest trees for short term biomass production: Final report, 16:33833 (R;LU)

**PLANT DISEASES**
Multi-phase system for monitoring and mapping forest disease making use of all available remote sensing data sources. Final report B1, 16:35131 (I;DE;In German)

**PLANT GROWTH**
Temperature of groundwater and plant-growth in Utzenstorf-Aefligen. Short report: Period of investigation 1985-1988, 16:35077 (R;CH;In German)

**PLANTS**
*See also* TREES
Archaeological studies at Drill Hole U20az Pahute Mesa, Nye county, Nevada, 16:35031 (R;US)
Ecological effects of pipeline construction through deciduous forested wetlands, Midland County, Michigan: Interim report, August 1988–August 1990, 16:33717 (R;US)
Tritium migration studies at the Nevada Test Site, 16:33747 (R;US)

High-temperature plasticity in copper polycrystals, 16:34501 (R;US)

**POLYCYCLIC AROMATIC HYDROCARBONS**
Differences of diurnal variations of some aliphatic and polycyclic aromatic hydrocarbons concentrations in aerosol of the urban area of Madrid, 16:34991 (R;ES;In Spanish)
Enhancement of fluorescence detection in chromatographic methods by computer analysis of second order data: Progress report, February 1, 1991–August 30, 1991, 16:34588 (R;US)
Fundamental studies with a monodisperse aerosol-based liquid chromatography/mass spectrometry interface (MAGIC-LC/MS): Progress report, December 1, 1990–November 30, 1991, 16:34587 (R;US)
Subproject: Cancerogenicity assessment of PAH of environmental and workplace relevance after intrapulmonary administration in rats, 16:35132 (I;DE;In German)

**POLYCYCLIC SULFUR HETEROCYCLES**
Reduced molybdenum oxidation states in hydrodesulfurization catalysis by Chevrel phases, 16:34728 (R;US)

**POLYENES**
*See also* DIENES
Controlled synthesis of polyenes by catalytic methods: Progress report, August 1, 1990–July 31, 1991, 16:34606 (R;US)

**POLYETHYLENES**
Deformability and strength properties of irradiated polyethylene with heterogeneous net of lateral bonds, 16:34553 (IA;SU;In Russian)
Long-term durability of polyethylene for encapsulation of low-level radioactive, hazardous, and mixed wastes, 16:33735 (R;US)

**POLYMERS**
A comparison of the neutron response of CR-39 made by different manufacturers, 16:34947 (R;US)
Atomic oxygen interaction with spacecraft materials: Relationship between orbital and ground-based testing for materials certification, 16:34835 (R;US)
Photothermal deflection spectroscopy of conjugated polymers, 16:34576 (R;US)
Prediction of radiation properties of polymers using increment method, 16:34743 (IA;SU;In Russian)
Radiation effects in composite materials on polymer mixture base, 16:34759 (IA;SU;In Russian)
Thermography of climatically and radiation aged polymers, 16:34556 (IA;SU;In Russian)

**POLYMETHYLMETHACRYLATES**
*See* PMMA

**POLYNUCLEAR AROMATIC HYDROCARBONS**
*See* POLYCYCLIC AROMATIC HYDROCARBONS

**POLYPEPTIDES**
Biosynthesis of metal-binding polypeptides and their precursors in response to cadmium in Datura innoxia, 16:35096 (R;US)

**POLYPROPYLENE**
Annual report of the Osaka Laboratory for Radiation Chemistry Japan Atomic Energy Research Institute, 22. April 1, 1988 - March 31, 1989, 16:34761 (R;JP)
Radiation induced structural changes, 16:34762 (R;JP;In Japanese)

**POLYSTYRENE-DVB**
Chemically modified polymeric resins for high performance liquid chromatography, solid-phase extraction and organic separation by LC and GC, 16:34592 (R;US)

**POLYTHENE**
*See* POLYETHYLENES

**POLYTHIONATES**
*See* OXYGEN COMPOUNDS

**POLYTHIONIC ACIDS**
*See* OXYGEN COMPOUNDS

**POLYURETHANES**
*See also* HALTHANE
Radiolysis and radiation-induced crosslinking of binding polymers of working layer of magnetic ribbons under accelerated electron irradiation, 16:34551 (IA;SU;In Russian)

**POLYVINYLS**
Piezoelectric polarization of the ferroelectric polymer PVDF from 10 MPa to 10 GPa: Studies of loading-path dependence, 16:34573 (R;US)

**PONDS**
Pond water analysis summary, 16:35084 (R;US)

**POOLS**
*See* PONDS

**PORE STRUCTURE**
*See* POROSITY

**POROSITY**
Pyrolysis and gasification of coal at high temperatures: Fourteenth quarterly progress report, December 15, 1990–March 15, 1991, 16:33560 (R;US)

**POROSITY REDUCTION**
*See* FORMATION DAMAGE

**POROUS MATERIALS**
TOUGH2: A general-purpose numerical simulator for multiphase fluid and heat flow, 16:33910 (R;US)

The modeling of complex continua: Fundamental obstacles and grand challenges: Progress report, 16:35178 (R;US)

**PORTSMOUTH GASEOUS DIFFUSION PLANT**
Portsmouth Gaseous Diffusion Plant Environmental report for 1990: Volume 4, 16:34233 (R;US)

**POSITION SENSITIVE DETECTORS**
New dimensions in atom probe analysis, 16:34962 (R;US)

**POSITRON SOURCES**
Alternative positron-target design for electron-positron colliders, 16:34905 (R;US)

**POSITRONS**
Positron lifetimes in solids from first principles calculations, 16:35357 (R;US)

**POST-IRRADIATION EXAMINATION**
A new computed tomography system in the ECN Hot Cell Laboratory, Netherlands, 16:34006 (RA;XA)
Application of mercurometric analysis methods to radioactive (and/or toxic) samples: Pycnometry and porosimetry, 16:34788 (RA;XA)
Study of the feasibility of using matrix isolation spectroscopy to characterise the chemical forms of fission products evolving from heated irradiated fuel samples, 16:34044 (RA;XA)

**POTABLE WATER**
*See* DRINKING WATER

**POTASSIUM CHLORIDES**
Effect of positron irradiation on lifetime of alkali halogen crystal in electric field, 16:35343 (IA;SU;In Russian)

**POTASSIUM FLUORIDES**
Compound fluoride cross-luminescence, 16:35346 (IA;SU;In Russian)
Cross-luminescence in alkali metal fluorides under pulsed synchrotron radiation excitation, 16:35345 (IA;SU;In Russian)

**POWER GENERATION**
Cost reduction of LWRs - The main features, 16:33994 (RA;XA)
Environmental Assessment for the Sacramento Area Office, Western Area Power Administration: Proposed 1994 Power Marketing Plan, 16:35029 (R;US)
Externalities in electric generation planning and development - A California status report, 16:34263 (RA;US)
Opportunities for renewable energy systems on military bases, 16:34264 (RA;US)

**POWER PLANTS**
*See also* FUEL CELL POWER PLANTS
HYDROELECTRIC POWER PLANTS
Environmental impact assessment in energy project investment, 16:33982 (R;IT;In Italian)
Estimated increases in the cost of electricity under three acid-rain control bills, 16:34410 (R;US)
Power plant by LIB fusion, 16:35467 (RA;JP)

**POWER POOLS**
*See* INTERCONNECTED POWER SYSTEMS

**POWER SYSTEMS**
*See also* AC SYSTEMS
INTERCONNECTED POWER SYSTEMS
An integrated energy approach to providing power and propulsion for the Space Exploration Initiative, 16:34214 (R;US)

**POWER TRANSMISSION LINES**
National Energy Strategy: Technical Annex 3, Electricity transmission access, 16:34217 (R;US)

**PRASEODYMIUM FLUORIDES**
Kinetics of reduction of preseodymium and neodymium fluorides mixtures with calcium, 16:34711 (IA;SU;In Russian)

**PRASEODYMIUM OXIDES**
Properties of epitaxial $YBa_2Cu_3O_{7-\delta}$-based superconducting superlattices, 16:34527 (R;US)

**PREAMPLIFIERS**
Performance of a new monolithic eight channel charge sensitive preamplifier-shaper, 16:34845 (R;US)

**PRECIPITATIONS (ATMOSPHERIC)**
*See* ATMOSPHERIC PRECIPITATIONS

**PRESSURE TUBES**
Hot cell examination of corrosion films on zirconium alloys using infrared spectroscopy, impedance and anodization techniques, 16:34016 (RA;XA)

**PRESSURE VESSELS**
Electromagnetic loads on ITER in-vessel components, 16:35426 (R;US)
Experimental and theoretical investigations for WWER pressure vessel neutron exposure evaluation in Czechoslovakia, 16:33991 (RA;XA)
Heavy-section steel technology program: Semiannual progress report for April 1990–September 1990, Volume 7, No. 2, 16:34203 (R;US)
Irradiation effects on Charpy impact and tensile properties of low upper-shelf welds, HSSI series 2 and 3, 16:33990 (R;US)
Solid state track recorder pressure vessel surveillance neutron dosimetry at commercial nuclear power reactors, 16:34046 (RA;XA)
Stress analysis of a double-wall vacuum vessel for ITER, 16:35427 (R;US)

**PRESSURIZED WATER COOLED MODERATED REACTOR**
*See* PWR TYPE REACTORS

**PRESSURIZED WATER REACTORS**

Contribution to the optimization of a network for monitoring and surveillance of environmental radioactivity in Spain, 16:34186 (RA;FR)
Denmark's on - line early warning radiation monitoring network, 16:34185 (RA;FR)
Environmental monitoring and the application of predictive models for nuclear emergencies in the Netherlands, 16:34187 (RA;FR)
Environmental radioactivity measurements in the field network of the deutscher wetterdienst. Methods and data transfer, 16:35010 (RA;FR)
Integrated measurement and information system for the surveillance of environmental radioactivity (IMIS) in the Federal Republic of Germany, 16:34055 (RA;FR)
Interfacing real-time monitoring data with a long range transport and dispersion model, 16:34191 (RA;FR)
Present status and future development of the European Community rapid information system, 16:34193 (RA;FR)
Real time radioactivity monitoring and its interface with predictive atmospheric transport modelling, 16:35009 (R;FR)
The fractal nature of the european network for airborne radioactivity monitoring and its implications for the detectability of radioactive clouds, 16:34192 (RA;FR)
The interpretation of gamma dose rate measurements in terms of airborne and deposited activity, 16:35011 (RA;FR)
The management of post-accident radiological data, 16:34189 (RA;FR)
UK arrangements for environmental monitoring in the event of a civil nuclear accident, 16:34184 (RA;FR)

**RADIATION PROTECTION**
**Administrative Procedures**
Issues in continuous air monitoring, 16:35013 (R;US)
**C Codes**
An evaluation of the effectiveness of the EPA comply code to demonstrate compliance with radionuclide emission standards at three manufacturing facilities, 16:34992 (RA;US)
**Implementation**
Impacts on power reactor health physics programs, 16:34121 (RA;US)
Issues in continuous air monitoring, 16:35013 (R;US)
Methodology for development of health physics procedures at research reactors in agreement states, 16:34122 (RA;US)
**Legal Aspects**
The legal aspects of fetal protection policies in the workplace, 16:35331 (RA;US)
**Meetings**
Proceedings of the conference on health physics: Future development of health physics, 16:35338 (R;JP;In Japanese)
**Optimization**
ALARA at nuclear power plants, 16:34127 (RA;US)
ALARA for the practical person, 16:35329 (RA;US)
New influences on the ALARA concept, 16:35330 (RA;US)
**Recommendations**
Benefits of the effective dose equivalent concept at a medical center, 16:35322 (RA;US)
Features of DOE implementation of radiation protection guidance, 16:35319 (RA;US)
Federal radiation protection guidance, 16:35318 (RA;US)
Implementation of NCRP 91 recommendations on occupational exposure to ionizing radiation at a large nuclear facility, 16:34120 (RA;US)
Implementation of recent ICRP guidance in Ontario Hydro's Radiation Safety Program, 16:34118 (RA;US)
NCRP and ICRP - What's happening?, 16:35321 (RA;US)
Recommendations, requirements, and radioactive particles, 16:34125 (RA;US)
Rethinking basic concepts in ICRP's system of dose limitation, 16:35320 (RA;US)
Skin dose from distributed radioactive sources and hot particles - Regulations and recommendations, 16:34128 (RA;US)
**Recording Systems**
Deficiencies in radiation protection record systems, 16:35324 (RA;US)
**Regulations**
Experiences in limiting radiation exposure to the embryo/fetus in nuclear power plants, 16:34130 (RA;US)
Is the ICRP-26 weighting factor for gonadal dose appropriate for new federal regulations?, 16:35328 (RA;US)
Teledosimetry in a spent fuel pool, 16:35327 (RA;US)
**Safety Standards**
Nuclear power industry review of 10 CFR 20 implementation documents, 16:34119 (RA;US)
Overview of the revised 10 CFR Part 20, standards for protection against radiation, 16:35325 (RA;US)
Technical basis document for internal dosimetry: Revision 1, 16:35127 (R;US)
**Standards**
Air sampling in the workplace to meet the new part 20 requirements, 16:34993 (RA;US)
The informed radiation worker and fetal dose policies, 16:35333 (RA;US)
University/Hospital fetal dose policy experiences, 16:35334 (RA;US)

An aerial radiological survey of the area surrounding the Palisades Plant Nuclear Reactor Site (South Haven, Michigan): Date of survey: June 1976, 16:35050 (R;US)
**Chemical Analysis**
Surface radiological investigations at White Wing Scrap Yard, Oak Ridge Reservation, Oak Ridge, Tennessee, 16:33797 (R;US)
**Contamination**
An aerial radiological survey of Argonne Site A, Palos Hills, Illinois: Date of survey: May 1976, 16:35052 (R;US)
Characterization studies on: (A) Contaminated batch of Rocky Flats soil (B) Uncontaminted batch of INEL soil, 16:35056 (R;US)
Hydrological and geochemical investigations of selenium behavior at Kesterson Reservoir: Annual report, October 1, 1989–September 30, 1990, 16:35061 (R;US)
Particle characterization of contaminated soil, 16:35055 (R;US)
Statistical character of toxic metal concentrations in soil samples contaminated by atmospheric deposition: Implications for compliance, 16:35020 (R;US)
**Decontamination**
STMVOC User's Guide, 16:35062 (R;US)
Soil washing: A preliminary assessment of its applicability to Hanford, 16:35063 (R;US)
**Detoxification**
Solar detoxification technology: Using energy from the sun to destroy hazardous waste, 16:33899 (R;US)
**Dose Limits**
Release criteria and pathway analysis for radiological remediation, 16:33799 (R;US)
**Evaporation**
Seasonal trends in environmental tritium concentrations in a small forest adjacent to a radioactive waste storage area, 16:35026 (R;US)
**Fluorescence Spectroscopy**
Particle characterization of contaminated soil, 16:35055 (R;US)
**Gamma Radiation**
Snow gaging by airborne radiological surveys, status through September 1972, 16:35036 (R;US)
**Ground Truth**
An aerial radiological survey of the area surrounding the Palisades Plant Nuclear Reactor Site (South Haven, Michigan): Date of survey: June 1976, 16:35050 (R;US)
**Layers**
Nonlinear attenuation effects outside the zone of macroscopic failure, 16:35153 (R;US)
**Melting**
Potential for using a six-phase alternating current power supply system for in situ vitrification, 16:33773 (R;US)
**Moisture**
Processes for identifying regional influences of and responses to increasing atmospheric $CO_2$ and climate change—The MINK Project: Report 3, Forest resources, 16:33849 (R;US)
**Porosity**
Snow gaging by airborne radiological surveys, status through September 1972, 16:35036 (R;US)
**Quantitative Chemical Analysis**
Humic substance formation during wastewater infiltration, 16:35028 (R;US)
**Radioactivity**
Particle characterization of contaminated soil, 16:35055 (R;US)
**Radiometric Surveys**
An aerial radiological survey of Argonne Site A, Palos Hills, Illinois: Date of survey: May 1976, 16:35052 (R;US)
**Radionuclide Migration**
Effect of radon dose on cleanup criteria and using RESRAD for chemical risk assessment, 16:35023 (R;US)
Radionuclides in surface soil at the Nevada Test Site, 16:35030 (R;US)
Tritium migration studies at the Nevada Test Site, 16:33747 (R;US)
**Sampling**
Characterization studies on: (A) Contaminated batch of Rocky Flats soil (B) Uncontaminted batch of INEL soil, 16:35056 (R;US)
Particle characterization of contaminated soil, 16:35055 (R;US)
**Soil Chemistry**
The chemical analysis of undisturbed forest soil cores - methods and results, 16:35060 (R;DE;In German)
**Spatial Distribution**
Statistical character of toxic metal concentrations in soil samples contaminated by atmospheric deposition: Implications for compliance, 16:35020 (R;US)
**Surveys**
Hydrological and geochemical investigations of selenium behavior at Kesterson Reservoir: Annual report, October 1, 1989–September 30, 1990, 16:35061 (R;US)
**Testing**
Characterization studies on: (A) Contaminated batch of Rocky Flats soil (B) Uncontaminted batch of INEL soil, 16:35056 (R;US)
**Vitrification**
Potential for using a six-phase alternating current power supply system for in situ vitrification, 16:33773 (R;US)
**Washing**
Soil washing results for mixed waste pond soils at Hanford, 16:35065 (R;US)
**SOLAR COLLECTORS**

PETRA STORAGE RING
SUPERCONDUCTING SUPER COLLIDER
A canonical eight-dimensional formalism for linear and non-linear classical spin-orbit motion in storage rings, 16:34921 (R;DE)
Applications of differential algebra to single-particle dynamics in storage rings, 16:34882 (R;US)
Study on beam lifetime of JSR, 16:34922 (R;JP;In Japanese)
**STORES**
*See* COMMERCIAL BUILDINGS
**STRAIN GAGES**
Accelerometer and strain gage evaluation, 16:33817 (R;US)
**STRANGE BARYONS**
*See* HYPERONS
**STRANGE PARTICLES**
*See also* HYPERONS
An experiment to observe strange particle production in ion collisions at the AGS, 16:35194 (R;US)
Recent CERN results on HBT, strangeness and $p_T$-spectra from $^{16}O$,$^{32}S$-nucleus collisions at 200 GeV/nucleon, 16:35248 (RA;US)
Strangeness production at 200 GeV/Nucleon, 16:35208 (R;US)
**STRATEGIC PETROLEUM RESERVE**
The depth of the oil/brine interface and crude oil leaks in SPR caverns, 16:33655 (R;US)
**STRENGTH (COMPRESSION)**
*See* COMPRESSION STRENGTH
**STRONG INTERACTIONS**
Measurement of the direct photon spectrum from Y(1S) decays, 16:35196 (R;DE)
**STRONTIUM 90**
Combining extractant systems for the simultaneous extraction of transuranic elements and selected fission products, 16:34581 (R;US)
Radioactivity survey data in Japan, part 1. Environmental materials, 16:35080 (R;JP)
Radioactivity survey data in Japan, part 2. Dietary materials, 16:35108 (R;JP)
**STRONTIUM COMPLEXES**
Synthesis and properties of volatile $\beta$-diketonates and imino-$\beta$-diketonates of Ca, Sr, Ba and their adducts, 16:34676 (IA;SU;In Russian)
**STRONTIUM COMPOUNDS**
*See also* STRONTIUM FLUORIDES
STRONTIUM OXIDES
Investigation of ceramic high-temperature superconductors of Bi-Sr-Ca-Cu-O-F system, 16:34535 (IA;SU;In Russian)
Structure of polycrystalline perrhenates from $^{185,187}Re$ NQR data, 16:34665 (IA;SU;In Russian)
**STRONTIUM FLUORIDES**
Borolanthanum glasses with strontium and yttrium fluorides, 16:34562 (IA;SU;In Russian)
Crystal preparation and study of dielectric properties of inorganic fluorides $AF_2$ (A=Ba, Sr, Pb, Cd), 16:34716 (IA;SU;In Russian)
Electric conductivity of solid electrolytes on the basis of $LaF_3$, 16:34703 (IA;SU;In Russian)
**STRONTIUM OXIDES**
Anharmonic lattice interaction and structural phase transition of the high-temperature superconductor $La_{2-x}Sr_xCuO_4$, 16:34539 (R;DE;In German)
Crystal structure of stage 1 iodine intercalated superconducting $IBi_2Sr_2CaCu_2O_x$, 16:34542 (R;US)
**STRUCTURAL MATERIALS**
*See* BUILDING MATERIALS
**STRUCTURES (BUILDINGS)**
*See* BUILDINGS
**STRUCTURES (MECHANICS)**
*See* MECHANICAL STRUCTURES
**STYRENE-DIVINYLBENZENE COPOLYMER**
*See* POLYSTYRENE-DVB
**SUBBITUMINOUS COAL**
Coal to char chemistry submodel development and evaluation, 16:33590 (RA;US)
Investigation of the rank dependence of tar evolution: Quarterly report, January 1, 1991–March 31, 1991, 16:33564 (R;US)
Task 3 - Advanced techniques for coal and mineral characterization, 16:33595 (RA;US)
Task 5 - Fundamental studies of mineral matter vaporization and residual ash formation, 16:33639 (RA;US)
Task 6 - Behavior and effects of coal mineral matter in laboratory pulverized coal combustor, 16:33640 (RA;US)
**SUBCONTRACTORS**
*See* CONTRACTORS

**SUBCOOLED BOILING**
Microchannel cooling with subcooled boiling: Executive summary of first year's results: Final report No. 1, 16:35182 (R;US)
**SUBCRITICAL FLOW**
*See* LAMINAR FLOW
**SUBSURFACE ENVIRONMENTS**
Control of water infiltration at humid area shallow land burial facilities: Progress report for FY 89, 16:33737 (R;US)
Earth Sciences Division annual report 1990, 16:35151 (R;US)
**SUBSURFACE STRUCTURES**
Archaeological mounds as analogs of engineered covers for waste disposal sites: Literature review and progress report, 16:33772 (R;US)
Control of water infiltration at humid area shallow land burial facilities: Progress report for FY 89, 16:33737 (R;US)
Robotics subsurface mapping demonstration technology test plan, 16:34783 (R;US)
**SUGAR BEETS**
Improving of energy tie up using the high temperature cooling crystallization, 16:34379 (RA;LU;In English, French)
**SULFATES**
*See also* COPPER SULFATES
MANGANESE SULFATES
Can sulfate fluxes in forest canopy throughfall be used to estimate atmospheric sulfur deposition?: A summary of recent results, 16:34994 (R;US)
**SULFITE WASTE LIQUOR**
*See* SPENT LIQUORS
**SULFONATES**
[Diosmacycloalkanes as models for the formation of hydrocarbons from surface methylenes]: Progress report, April 1, 1990–October 31, 1991, 16:34605 (R;US)
**SULFONIC ACIDS**
Improved electrolytes for fuel cells, Part A, 16:34302 (RA;US)
Improved electrolytes for fuel cells, Part B, 16:34303 (RA;US)
**SULFUR**
Can sulfate fluxes in forest canopy throughfall be used to estimate atmospheric sulfur deposition?: A summary of recent results, 16:34994 (R;US)
Cost-efficiency of measures to reduce sulphur deposition, 16:35067 (R;FI;In Finnish)
Halogen treatment of char for the removal of sulfur and mineral matter: Final report, June 24, 1987–September 23, 1990, 16:33558 (R;US)
High-temperature corrosion of Nicalon®/SiC composites, 16:33975 (R;US)
Radiochemical determination of the solubility of sulfur in metals, 16:34519 (R;US)
**SULFUR 32 REACTIONS**
Recent CERN results on HBT, strangeness and $p_T$-spectra from $^{16}O,^{32}S$-nucleus collisions at 200 GeV/nucleon, 16:35248 (RA;US)
**SULFUR CYCLE**
Can sulfate fluxes in forest canopy throughfall be used to estimate atmospheric sulfur deposition?: A summary of recent results, 16:34994 (R;US)
**SULFUR DIOXIDE**
Alternative formulations of regenerable flue gas cleanup catalysts: Progress report, March 1, 1991–May 31, 1991, 16:33978 (R;US)
Cross-flow, filter-sorbent catalyst for particulate, $SO_2$ and $NO_x$ control: Sixth quarterly technical progress report, 16:33602 (R;US)
Environmental monitoring for the DOE coolside and LIMB demonstration extension projects: Final report, August–October 1990, 16:33977 (R;US)
High temperature membranes for $H_2S$ and $SO_2$ separations: Quarterly progress report, March 1, 1991–June 30, 1991, 16:33578 (R;US)
Permitting and solid waste management issues for the Bailly Station wet limestone Advanced Flue Gas Desulfurization (AFGD) system, 16:33976 (R;US)
Physico-chemical behaviour analysis of air pollutants in a complex coastal site: Castellon, 16:34990 (R;ES;In Spanish)
$SO_2$ and $NO_x$ emission scenarios and the costs of reduction measures in Finland, 16:35021 (R;FI;In Finnish)
$SO_x/NO_x$ submodel development, 16:33599 (RA;US)
$SO_x/NO_x$ submodel evaluation, 16:33600 (RA;US)
**SULFUR HYDRIDES**
*See* HYDROGEN SULFIDES
**SULFUR SULFIDES**
*See* SULFUR
**SULFUR TRIOXIDE**
$SO_x/NO_x$ submodel development, 16:33599 (RA;US)
**SUPERCOMPUTERS**
*See also* CEDAR COMPUTERS
Los Alamos National Laboratory's high-performance data system, 16:35509 (R;US)
Proceedings of the first energy research power supercomputer users symposium, 16:35500 (R;US)
Requirements for a Network Storage Service in a supercomputer environment, 16:35525 (R;US)
**SUPERCONDUCTING CABLES**
Magnetic field in the SSC arc quad, 16:34904 (R;US)
Resolutions to difficulties experienced in SSC cable fabrication during the initial scale-up period, 16:34914 (R;US)
SSC 40 mm cable results and 50 mm design discussions, 16:34915 (R;US)
**SUPERCONDUCTING MAGNETIC ENERGY STORAGE**
Evaluation of the toroidal-type superconducting magnetic energy storage system (SMES), 16:34220 (R;US)
**SUPERCONDUCTING MAGNETS**
An update on passive correctors for the SSC dipole magnets, 16:34880 (R;US)
Construction and results of the 50 mm short R&D dipole magnets, 16:34884 (R;US)
Magnetic field in the end region of the SSC quadrupole magnet, 16:34877 (R;US)
Mechanical and electromagnetic analysis of 50 millimeter designs for the SSC dipole, 16:34916 (R;US)
Quench propagation in the SSC dipole magnets, 16:34917 (R;US)
Status of 4-cm-aperture, 17-m-long SSC dipole magnet R&D program at BNL: Part 1, Magnet assembly, 16:34912 (R;US)
Status of 4-cm-aperture, 17-m-long SSC dipole magnet R&D program at BNL: Part 2, Mechanical behavior, 16:34919 (R;US)
Three-dimensional magnetic field produced by an axisymmetric iron yoke, 16:34876 (R;US)
**SUPERCONDUCTING SUPER COLLIDER**
Application of system safety engineering techniques for hazard prevention at the Superconducting Super Collider, 16:34869 (R;US)
High-brightness injectors for hadron colliders, 16:34896 (R;US)
The SSC beam scraper system, 16:34918 (R;US)
The SSC field Bus: A high-performance control system front end concentrator for "slow" accelerator controls, 16:34913 (R;US)
**SUPERCONDUCTIVITY**
High-Tc superconductivity: Laboratory report, 16:35361 (I;DK)
High-Tc superconductivity: Summary report, 16:35360 (I;DK)
**SUPERCONDUCTORS**
*See also* HIGH-TC SUPERCONDUCTORS
TYPE-II SUPERCONDUCTORS
Vortex-lattice states of a two-dimensional electron system at strong magnetic fields, 16:35358 (R;US)
**SUPERCRITICAL FLOW**
*See* TURBULENT FLOW
**SUPERFUND**
Health and Safety Plan for operations performed for the Environmental Restoration Program: Task: Vapor vacuum extraction, 16:33805 (R;US)
**SUPERGRAVITY**
Two-dimensional gravities and supergravities as integrable systems, 16:35362 (R;DE)
**SUPERHEATERS**
Evaluation of the fabricability of advanced austenitic tubing, 16:33974 (R;US)
**SUPERSYMMETRIC PARTICLES**
*See* SPARTICLES

**SUPERSYMMETRY**
Physical interpretation of supercoherent states and their associated Grassmann numbers, 16:35234 (R;US)
WZW superconformal blocks from three dimensions, 16:35236 (R;DE)
**SUPERVOLTAGE RADIOTHERAPY**
*See* RADIOTHERAPY
**SURFACE AREA**
Local phase distribution and interfacial area in a horizontal bubbly two-phase flow, 16:35176 (R;US)
**SURFACE BOILING**
*See* SUBCOOLED BOILING
**SURFACE FINISHING**
Automated edge finishing using an active XY table, 16:34406 (R;US)
**SURFACE WATERS**
*See also* COASTAL WATERS
ESTUARIES
PONDS
SWIMMING POOLS
Environmentally sound irrigated agriculture in the arid west: New challenges for water resources planners and environmental scientists, 16:34400 (R;US)
Evaluation of proposed designs for streamflow monitoring structures at waste disposal sites, 16:35074 (R;US)
**SURFACE-ACTIVE AGENTS**
*See* SURFACTANTS
**SURFACES**
Application of a structured light source to waste surface mapping in waste storage silos at Fernald, Ohio, 16:33756 (R;US)
Computer aided surface representation: [Final report], 16:35503 (R;US)
**SURFACTANTS**
The remobilization of the interfaces of moving bubbles and drops retarded by surfactant adsorption, 16:34816 (RA;US)

The Advanced Light Source: Status report, 16:34865 (R;US)
**SYNTHESIS GAS**
Biological production of ethanol from coal, March 22, 1991–June 21, 1991, 16:33570 (R;US)
Probe molecule studies: Active species in alcohol synthesis: Third quarterly report, April 1991–June 1991, 16:33580 (R;US)
**SYRIA**
Perspective of wind energy in the Syrian Arab Republic, 16:33952 (RA;DK)

## T

**TAILINGS**
Geotechnical properties and environmental effects of tailings, 16:33719 (R;FI;In Finnish)
**TANK FARMS**
*See* STORAGE FACILITIES
**TANKS**
*See also* ACCUMULATORS
Hanford Federal Facility Agreement and Consent Order quarterly progress report for the period ending June 30, 1991, 16:33804 (R;US)
Long-reach manipulation for waste storage tank remediation, 16:34780 (R;US)
Overview of seismic panel activities, 16:33812 (R;US)
Potential for using a six-phase alternating current power supply system for in situ vitrification, 16:33773 (R;US)
Tank Farm Upgrades Program Plan, 16:33795 (R;US)
Tank farm surveillance and waste status report for April 1991, 16:33793 (R;US)
Tank farm surveillance and waste status report for March 1991, 16:33792 (R;US)
Ultrasonic inspection of the inner and outer surfaces of components in contact with liquids using horizontally polarized shear waves. Final report, 16:34834 (R;DE;In German)
**TANTALATES**
Kinetics of lithium tantalate dissolution in hydrofluoric and sulfuric acid mixture, 16:34722 (IA;SU;In Russian)
**TANTALUM COMPLEXES**
Investigation of rare metal ion complexing with butylphenol-formaldehyde oligomers by spectroscopy methods, 16:34643 (IA;SU;In Russian)
**TANTALUM FLUORIDES**
Applied aspects of niobium and tantalum fluoride chemistry, 16:34692 (IA;SU;In Russian)
High temperature treatment of fluoride niobium-and tantalum-containing solutions, 16:34693 (IA;SU;In Russian)
On some properties of potassium heptafluorotantalate ($K_2TaF_7$), 16:34697 (IA;SU;In Russian)
Thermodynamics of lower fluorides of niobium and tantalum $NbF_{2.5}$, $NbF_4$, $TaF_3$, 16:34699 (IA;SU;In Russian)
**TANTALUM OXIDES**
High temperature treatment of fluoride niobium-and tantalum-containing solutions, 16:34693 (IA;SU;In Russian)
On the problem of fluorine impurity in rare metal oxide powders obtained by plasmochemical method, 16:34694 (IA;SU;In Russian)
**TANTALUM SILICATES**
The synthesis, characterization and catalytic reactions of metal silicate catalysts for the partial oxidation of methane, 16:33716 (RA;US)
**TAR**
*See also* BITUMENS
COAL TAR
Interim report on conversion of coal to liquids via catalytic hydropyrolysis, 16:33586 (R;US)
Kinetics of coal pyrolysis and devolatilization: Technical progress report, May 1, 1987–July 31, 1987, 16:33627 (R;US)
**TAR SAND OIL**
*See* BITUMENS

YTTRIUM OXIDES
YTTRIUM SILICATES
Effects of ambient background gases on YBCO plume propagation under film growth conditions: Spectroscopic, ion probe, and fast photographic studies, 16:34437 (R;US)
Synthesis and certain physico-chemical properties of lanthanum and yttrium dichlorofluorides, 16:34715 (IA;SU;In Russian)

**YTTRIUM FLUORIDES**
Borolanthanum glasses with strontium and yttrium fluorides, 16:34562 (IA;SU;In Russian)
Compound fluoride cross-luminescence, 16:35346 (IA;SU;In Russian)
Cross-luminescence in alkali metal fluorides under pulsed synchrotron radiation excitation, 16:35345 (IA;SU;In Russian)
High purity fluorides of elements for fiber optics, 16:34687 (IA;SU;In Russian)
Synthesis and growth of optical crystals $Na_{0.4}(Ln,Y)_{0.6}F_{2.2}$, 16:34704 (IA;SU;In Russian)
Synthesis of complex fluorides showing promise as materials for ionizing radiation detectors on the basis of cross-luminescence phenomenon, 16:34702 (IA;SU;In Russian)

**YTTRIUM OXIDES**
Chemical thermodynamic equilibria and conductivity of nonstoichiometric $YB_2Cu_3O_{7-\delta}$: A review, 16:34524 (R;US)
Energetics and statistics of order in alloys with application to oxide superconductors, 16:34543 (R;US)
Influence of $\gamma$-radiation on thermal stability of disperse oxide phase in nickel, 16:34452 (IA;SU;In Russian)
Laser ablation synthesis and properties of epitaxial $YBa_2Cu_3O_{7-\delta}/PrBa_2Cu_3O_{7-\delta}$ superconducting superlattices, 16:34528 (R;US)
Magnetization studies of irradiation modified single crystal $Y_1Ba_2Cu_3O_7$ superconductors: Flux creep and annealing effects, 16:34526 (R;US)
Non-stoichiometric defects in YBaCuO thin films, 16:34541 (R;US)
Properties of epitaxial $YBa_2Cu_3O_{7-\delta}$-based superconducting superlattices, 16:34527 (R;US)
Theoretical modeling and experimental characterization of planar defects in $Y_2Ba_4Cu_{6+x}O_{14+x}$, 16:34540 (R;US)
Use of xenon difluoride for oxygen extraction and determination in superconducting ceramics $YBa_2Cu_3O_{7-x}$, 16:34591 (IA;SU;In Russian)
Zirconia-based electrodes for solid oxide fuel cells, 16:34280 (RA;US)

**YTTRIUM SILICATES**
The synthesis, characterization and catalytic reactions of metal silicate catalysts for the partial oxidation of methane, 16:33716 (RA;US)

**YUCCA MOUNTAIN**
Air-injection field tests to determine the effect of a heat cycle on the permeability of welded tuff, 16:33789 (R;US)
Exploratory Studies Facility alternatives study: Final report: Volume 1, Executive summary, supporting information, and study conclusions: Yucca Mountain Site Characterization Project, 16:33781 (R;US)
Exploratory Studies Facility alternatives study: Final report: Volume 2, A comparative evaluation of alternative exploratory studies facility options: Yucca Mountain Site Characterization Project (Yucca Mountain Project:a1), 16:33782 (R;US)

**YUGOSLAVIA**
Wind energy in Yugoslavia, 16:33931 (RA;DK)

## Z

**Z NEUTRAL BOSONS**
A measurement of the branching ratio of the Z boson to bottom quarks using precision tracking, 16:35213 (R;US)

Bounds on the top mass from Z decays into b quarks, 16:35226 (R;DE)
Effects of shower spreading on $Z^{o} \rightarrow J J$ mass resolution, 16:35190 (R;US)
Identifying the origin of new gauge bosons at the SSC and LHC, 16:35187 (R;US)
Measuring the mass and width of the $Z^{0}$: The status of the energy spectrometers, 16:35214 (R;US)
$Z^{o} \rightarrow$ hadrons in SDC, 16:35189 (R;US)

**ZEOLITES**
Effect of the radiolysis of NaA and NaY zeolites on the adsorption properties, 16:34749 (IA;SU;In Russian)

**ZIMBABWE**
Wind speeds in Zimbabwe, 16:33959 (RA;DK)

**ZINC**
Radioactive zinc ($^{65}Zn$), zinc, cadmium, and mercury in the Pacific Hake, Merluccius productus (Ayres), off the West Coast of the United States, 16:35085 (R;US)

**ZINC 64 TARGET**
Nuclear Medicine Program progress report for quarter ending June 30, 1991, 16:34775 (R;US)

**ZINC ALLOYS**
Neutron Brillouin scattering in a metallic glass, 16:35350 (R;US)

**ZINC CHLORIDES**
Dynamics of vitreous and molten zinc chloride, 16:34548 (R;US)

**ZINC OXIDES**
Hot gas desulfurization with sorbents containing oxides of zinc, iron, vanadium and copper: Quarterly technical progress report, 16:33582 (R;US)
Methane oxidation over dual redox catalysts, 16:33710 (RA;US)
Pore structure and reactivity changes in hot coal gas desulfurization sorbents: Technical progress report, October–December 1990, 16:33559 (R;US)
Probe molecule studies: Active species in alcohol synthesis: Third quarterly report, April 1991–June 1991, 16:33580 (R;US)
Research on stable, high-efficiency, amorphous silicon multijunction modules: Annual subcontract report, 1 May 1990–30 April 1991, 16:33856 (R;US)
Unadditivity under combined irradiation of zinc oxide-polymethyl siloxane system by ultraviolet radiation, protons and electrons, 16:34554 (IA;SU;In Russian)

**ZIRCON**
Investigation of the processes of zircon concentrate fluorination with elemental fluorine and silicon tetrafluoride trapping by sodium carbonate, 16:34709 (IA;SU;In Russian)

**ZIRCONIUM BASE ALLOYS**
Mechanistic understanding of irradiation corrosion of zirconium alloys in nuclear power plants: stimuli, status and outlook, 16:34462 (IA;SU)
Regularities and mechanism of radiation-induced atmospheric corrosion of metals, 16:34454 (IA;SU;In Russian)

**ZIRCONIUM COMPLEXES**
Coordination compounds of immobile luminescent reagents with rare elements, 16:34660 (IA;SU;In Russian)
Features of structure of hexaaquomagnesium 2-carboxy-8-mercaptoquinolinate tetrahydrate and zirconium and hafnium 2-carboxy-8-mercaptoquinolinates, 16:34670 (IA;SU;In Russian)
Photo- and heat stimulated processes in coordination compounds of metals with dimethyl sulfoxide and dimethyl formamide, 16:34685 (IA;SU;In Russian)
Polynuclear complexing: relation of stereoeffects and structure, 16:34640 (IA;SU;In Russian)
Sensitization effect in rare earth complexes on the basis of aprotic inorganic solvents, 16:34628 (IA;SU;In Russian)
Study of formation amd properties of complexex in the system $ZrO_2$-$H_2SO_4$-$NH_4F$-$H_2O$, 16:34719 (IA;SU;In Russian)

**ZIRCONIUM FLUORIDES**
High purity fluorides of elements for fiber optics, 16:34687 (IA;SU;In Russian)
Investigation of the mechanism of high purification of zirconium and hafnium tetrafluorides from transition metals, 16:34688 (IA;SU;In Russian)
Preparation of fluoride products from the Kola titanium-and zirconium-containing raw materials, 16:34718 (IA;SU;In Russian)
Volume desublimation of zirconium tetrafluoride, 16:34710 (IA;SU;In Russian)

**ZIRCONIUM OXIDES**
Influence of $\gamma$-radiation on thermal stability of disperse oxide phase in nickel, 16:34452 (IA;SU;In Russian)
Peculiar features of optical degradation of $ZrO_2$+polymethylsiloxane system under separate and combined ultraviolet and electron irradiation, 16:34555 (IA;SU;In Russian)
Study of formation amd properties of complexex in the system $ZrO_2$-$H_2SO_4$-$NH_4F$-$H_2O$, 16:34719 (IA;SU;In Russian)
Zirconia-based electrodes for solid oxide fuel cells, 16:34280 (RA;US)
Zirconium oxide materials: Microstructural and mechanical characterization, 16:34530 (R;IT;In Italian)

**ZIRCONIUM SILICATES**
The synthesis, characterization and catalytic reactions of metal silicate catalysts for the partial oxidation of methane, 16:33716 (RA;US)

# Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

| Contract No. | Abstract No. | Report No. |
|---|---|---|
| **AC01-85PE77029** | **Applied Energy Services, Inc., Arlington, VA (United States)** | |

# Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

| *Report Number* | *Abstract Number* | *Source of Availability* | *GPO Dep.* | *Order Number* | *Distribution Category* |

# Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

# ORDER FORM

**DOE and DOE Contractors:** Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

## I. SHIPPING AND PAYMENT INFORMATION

**Ordering Address**

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

**Shipping Address (if different from above)**

Name _____

Address _____

City _____ State _____ Zip _____

_____

**SIGNATURE (Required to validate ALL orders)**

## II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

## III. NTIS ORDERS

☐ Charge NTIS deposit account no.

☐ Check/Money Order enclosed for $

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____
**Account Number** **Card expiration date**

☐ Ship and Bill (see below for restrictions)

Employer identification number (9 digits) _ _–_ _ _ _ _ _ _

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

## IV. SELECTIONS

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

# Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
